KRYPTON (Kr)

Z = 36

Kr I and II

Ref. 61, 121, 123, 147, 208, 232

— E.F.W.

Note: Wavelengths given to three decimal places below 11,000 Å are for the 86 isotope. Because of the small isotope shifts in Kr, the wavelengths applicable to natural Kr should not differ from those for Kr^{86} by more than about two units in the last decimal place given.

MERCURY (Hg)

Z = 80

Hg I and II
Ref. 10, 34, 43, 45, 50, 69, 90, 117, 133, 145, 189, 229, 235, 242, 304, 327, 328, 339 — R.W.S.

Note: Wavelengths are for natural mercury, except where no figures are given to the left of the decimal point; in these cases the decimal places are those that apply to the 198 isotopes.

ATOMIC TRANSITION PROBABILITIES

Compiled by W. L. Wiese and G. A. Martin

These tables were prepared under the auspices of the Committee on Line Spectra of the Elements of the National Academy of Sciences — National Research Council. They contain critically evaluated atomic transition probabilities A for about 4000 selected lines of elements from hydrogen to nickel. The material is largely for neutral and singly ionized spectra, but includes a number of prominent lines of more highly charged ions.

Most of the data are obtained from comprehensive compilations of the National Bureau of Standards Data Center on Atomic Transition Probabilities. Specifically, data have been taken from critical compilations on Sc,[1] Ti,[1] V,[2] Cr,[2] Mn,[2] and Fe[3] without changes. Material from earlier compilations for the elements H through Ne[4] and for Na through Ca[5] was supplemented by more recent material taken directly from the original literature. For the higher ions, most data were derived from studies of the systematic behavior of transition probabilities.[6–8] The original literature is cited in a very recent bibliography on transition probabilities.[9]

The wavelength range for the neutral species has normally been restricted to the visible or shorter wavelengths; only the most prominent near infrared lines are included. For the higher ions, most prominent lines are located in the extreme uv. The tabulation is limited to electric dipole — including intercombination — lines and comprises essentially the fairly strong transitions (usually $gf > 10^{-3}$) with estimated uncertainties of 50% or less. With the exception of hydrogen and helium, most transitions are between states with fairly low principal quantum numbers, i.e., not exceeding the quantum number of the ground state by more than two.

Whenever the wavelengths of individual lines within a multiplet are extremely close, an average wavelength for the multiplet is given, followed by an asterisk (*). This has also been done when the transition probability for an entire multiplet has been taken from the literature and values for individual lines cannot be determined because of insufficient knowledge of the coupling of electrons. The statistical weights, g_i and g_k, for the lower (i) and upper (k) atomic states are listed since the product g_kA (or g_if) is needed in many applications. A is given in units of 10^8 s^{-1}and is listed to as many digits as is consistent with the indicated accuracy. A number in parentheses following the tabulated value of the transition probability indicates the power of ten by which this value has to be multiplied. The uncertainties of the transition probabilities are indicated by code letters as follows: AA for uncertainties within 1%; A for uncertainties within 3%; B for uncertainties within 10%; C for uncertainties within 25%; D for uncertainties within 50%. The listed uncertainties are used with the connotation of "extent of possible error."

In the table for hydrogen, the uncertainty column has been eliminated since the transition probabilities for this element are known very precisely (< 1% error). Due to the hydrogen degeneracy, a "transition" is actually the sum of all transitions between the principal quantum numbers listed in the transition column, and the tabulation represents the properly weighted total A values.

In addition to the transition probability A, the atomic oscillator-strength f and the line-strength S are often used in the literature. The conversion factors between these quantities are:

$$g_i f = 1.499 \times 10^{-8} \lambda^2 g_k A = 303.8 \lambda^{-1} S$$

where λ is in Angströms, A is in 10^8 s^{-1}, and S is in atomic units, which are $a_0^2 e^2 = 7.188 \times 10^{-59} \mathrm{m}^2\mathrm{C}^2$ for electric dipole transitions.

We acknowledge the very valuable preparatory work by D. Trahan and W. Croom in arranging and compiling the numerical data.

Table 1a
TRANSITION PROBABILITIES FOR ALLOWED LINES OF HYDROGEN

For hydrogen-like ions of nuclear charge Z, the following scaling laws hold:

$A_Z = Z^4 A_{Hydrogen}$; $f_Z = f_H$; $S_Z = Z^{-2} S_H$
(For wavelengths $\lambda_Z = Z^{-2} \lambda_H$).

For lines which, due to the scaling, shift from the air to the vacuum region, the (tabulated) experimental wavelengths in air and corresponding A-values have to be converted first to vacuum values.[10] For highly charged ions, relativistic effects need to be taken into account.[11]

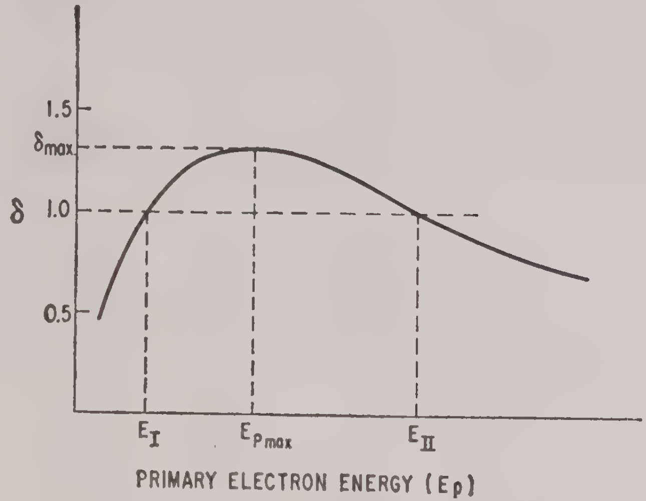
The secondary emission yield, or secondary emission ratio, δ, is the average number of secondary electrons emitted from a bombarded material for every incident primary electron. The secondary emission yield is a function of the primary electron energy. $\delta_{\max}$ is the maximum yield corresponding to a primary electron energy $E_{p\,\max}$ (see figure). The two primary electron energies corresponding to a yield of unity are denoted the first and second crossovers (E_I and E_{II}). An insulating target, or a conducting target that is electrically floating, will charge positively or negatively depending on the primary electron energy. For $E_I < E_p < E_{II}$, $\delta > 1$ and the surface charges positively provided there is a collector present that is positive with respect to the target. For $E_p < E_I$, $\delta < 1$, and the surface charges negatively towards the potential of the source of primary electrons. For $E_p > E_{II}$, $\delta < 1$, and the surface charges negatively to the second crossover.



The secondary emission yield is very sensitive to surface contamination, such as oxide films and carbon deposits. Whenever possible, yields believed to be most typical of clean surfaces have been selected. The yields are for measurements at room temperature and normal incidence of the primary electrons.

Table I

Secondary Electron Emission Properties of Elements and Compounds. $\delta_{\max}$ is the maximum secondary emission yield, $E_{p\,\max}$ the primary electron energy for maximum yield, and E_I and E_{II} are the first and second crossovers.

LIQUIDS FOR INDEX BY IMMERSION METHOD

Liquid	N_D 24° C
Trimethylene chloride	1.446
Cineole	1.456
Hexahydrophenol	1.466
Decahydronaphthalene	1.477
Isoamylphthalate	1.486
Tetrachloroethane	1.492
Pentachloroethane	1.501
Trimethylene bromide	1.513
Chlorobenzene	1.523
Ethylene bromide + Chlorobenzene	1.533
o-Nitrotoluene	1.544
Xylidine	1.557
o-Toluidine	1.570
Aniline	1.584
Bromoform	1.595
Iodobenzene + Bromobenzene	1.603
Iodobenzene + Bromobenzene	1.613
Quinoline	1.622
α-Chloronaphthalene	1.633
α-Bromonaphthalene + α-Chloronaphthalene	1.640–1.650
α-Bromonaphthalene + α-Iodonaphthalene	1.660–1.690
Methylene iodide + Iodobenzene	1.700–1.730
Methylene iodide	1.738
Methylene iodide saturated with sulfur	1.78
Yellow phosphorus, sulfur and methylene iodide (8:1:1 by weight) Can be diluted with methylene iodide to cover range 1.74-2.06. For precautions in use, cf. West, Am. Mineral, **21**, p. 245–9 (1936).	2.06

HEAVY LIQUIDS FOR MINERAL SEPARATION

Liquid	Density
Tetrabromoethane (sym.) Can be diluted with carbon tetrachloride (1.595) or benzene (0.894).	2.964, 20°/4°
Methylene iodide Can be diluted with carbon tetrachloride or benzene.	3.325, 20°/4°
Thallium formate, aq Can be diluted with water.	3.5
Thallium malonate-thallium formate, aq Can be diluted with water.	4.9

For preparation and recovery of these liquids, cf. U. S. Bureau Mines, Rept. Inv. #2897 (1928).

INDEX OF REFRACTION

Indices of refraction for elements, inorganic, metal-organic and organic compounds and minerals will be found in the tables of physical constants for the various classes of substances in the section Properties and Physical Constants.

Values for compounds not there listed and data subsequently collected are given below.

Indices not otherwise indicated are for sodium light, λ = 589.3 mμ. Other wave lengths are indicated by the value in millimicrons or symbol in parentheses which follows the index. Wave lengths are indicated as follows: He, λ = 587.6 mμ; Li, λ = 670.8 mμ; Hg, λ = 579.1 mμ; A, λ = 759.4 mμ; C, λ = 656.3 mμ; D, λ = 589.3 mμ; F, λ = 486.1 mμ.

Temperatures are understood to be 20°C for liquids, or ordinary room temperatures in the case of solids. Other temperatures appear as superior figures with the index.

Indices for the elements and inorganic compounds will be understood to be for the solid form except as indicated by the abbreviation liq.

See also under Physical Constants of Inorganic Compounds and index of Refraction of Gases.

ELEMENTS

Name	Formula	Index
Bromine (liq.)	Br_2	1.661^{15}
Cadmium (liq.)	Cd	0.82 (579 mμ)
(sol.)		1.13
Chlorine (liq.)	Cl_2	1.385

INORGANIC COMPOUNDS

See also under Physical Constants of Inorganic Compounds.

Aluminum carbide	Al_4C_3	2.7, 2.75 (700 mμ)
chloride	$AlCl_3.6H_2O$	1.560, 1.507
oxide	Al_2O_3	1.665–1.680, 1.63–1.65
Alums. See under appropriate element.		
Ammonium antimonyl tartrate	$2(NH_4.SbO.C_4H_4O_6).H_2O$	β1.6229 (C)
*ortho*arsenate, di-H	$NH_4H_2AsO_4$	1.5766, 1.5217
bromide	NH_4Br	1.7108
*per*chlorate	NH_4ClO_4	1.4818, 1.4833, 1.4881
chloroplatinate	$(NH_4)_2PtCl_6$	1.8
fluoride	NH_4F	ω<1.328
" acid	NH_4HF_2	1.385, 1.390, 1.394
hydrogen malate (*d*)	$NH_4C_4H_5O_5$	β1.503
nitrate	NH_4NO_3	1.413, 1.611(He), 1.63
Ammonium sulfate, acid	NH_4HSO_4	1.463, 1.473, 1.510
tartrate (*dl*)	$(NH_4)_2C_4H_4O_6.2H_2O$	β1.564
thiocyanate	NH_4CNS	1.546, 1.685, 1.692
uranyl acetate	$NH_4C_2H_3O_2.UO_2(C_2H_3O_2)_2$	1.4808, 1.4933
Antimony bromide	$SbBr_3$	>1.74+
iodide, tri-	SbI_3	2.78 (Li), 2.36
Barium cadmium bromide	$BaCdBr_4.4H_2O$	β1.702
cadmium chloride	$BaCdCl_4.4H_2O$	β1.651
calcium propionate	$BaCa_2(C_3H_5O_2)_6$	1.4442
fluochloride	$BaCl_2.BaF_2$	1.640, 1.633
fluoride	BaF_2	1.475 also 1.4741
Barium oxide	BaO	1.980
*ortho*phosphate, di-	$BaHPO_4$	1.617, 1.63±, 1.635
propionate	$Ba(C_2H_5CO_2)_2.H_2O$	β1.5175
sulfide, mono-	BaS	2.155
Cadmium ammonium chloride	$CdCl_2.4NH_4Cl$	1.6038, 1.6042
cesium sulfate	$CdSO_4.Cs_2SO_4.6H_2O$	1.498, 1.500, 1.506
fluoride	CdF_2	1.56
magnesium chloride	$(CdCl_2)_2.MgCl_2.12H_2O$	1.49, 1.5331, 1.5769
oxide	CdO	2.49 (Li)
potassium chloride	$CdCl_2.4KCl$	1.5906, 1.5907
" cyanide	$Cd(CN)_2.2KCN$	1.4213
rubidium sulfate	$CdSO_4.Rb_2SO_4.6H_2O$	1.4798, 1.4848, 1.4948
Calcium aluminate	$Ca_3Al_2O_6$	1.710
borate	$CaO.B_2O_3$	1.540, 1.656, 1.682
carbide	CaC_2	>1.75
copper acetate	$CaCu(C_2H_3O_2)_4.6H_2O$	1.436, 1.478
cyanamide	$CaCN_2$	1.60, >1.95
dithionate	$CaS_2O_6.4H_2O$	1.5516, 1.5414
*pyro*phosphate	$Ca_2P_2O_7$	1.585, 1.60±, 1.605
platinocyanide	$CaPt(CN)_4.5H_2O$	1.623, 1.644, 1.767
strontium propionate	$Ca_2Sr(C_3H_5O_2)_6$	1.4871, 1.4956
sulfide (oldhamite)	CaS	2.137
sulfite	$CaSO_3.2H_2O$	1.590, 1.595, 1.628
thiosulfate	$CaS_2O_3.6H_2O$	1.545, 1.560, 1.605
Carbon dioxide (liq.)	CO_2	1.195^{15}
Cerium dithionate	$Ce_2(S_2O_6)_3.15H_2O$	β1.507
Cesium *per*chlorate	$CsClO_4$	1.4752, 1.4788, 1.4804
nitrate	$CsNO_3$	1.55, 1.56
selenate	Cs_2SeO_4	1.5989, 1.5999, 1.6003
thallium chloride	$Cs_3Tl_2Cl_9$	1.784, 1.774
Chromium cesium sulfate	$CrCs(SO_4)_2.12H_2O$	1.4810
oxide (ic)	Cr_2O_3	2.5
potassium cyanide (ic)	$CrK_3(CN)_6$	1.5221, 1.5244, 1.5373
sulfate (ic)	$Cr_2(SO_4)_3.18H_2O$	1.564
thallium sulfate	$CrTl(SO_4)_2.12H_2O$	1.5228
Cobalt acetate	$Co(C_2H_3O_2)_2.4H_2O$	β1.542
aluminate (Thenard's Blue)	$Co(AlO_2)_2$	>1.78 (red), 1.74 (blue)
ammonium selenate	$CoSeO_4.(NH_4)_2SeO_4.6H_2O$	1.5246, 1.5311, 1.5396
cesium sulfate	$CoCs_2(SO_4)_2.6H_2O$	1.5057, 1.5085, 1.5132
chloride (ous)	$CoCl_2.2H_2O$	<1.625, <1.671, >1.67
potassium selenate	$CoSeO_4.K_2SeO_4.6H_2O$	1.5135, 1.5195, 1.5358
rubidium sulfate	$CoSO_4.Rb_2SO_4.6H_2O$	1.4859, 1.4916, 1.5014
selenate	$CoSeO_4.6H_2O$	β1.5225, γ1.5227
Copper ammonium selenate	$CuSeO_4.(NH_4)_2SeO_4.6H_2O$	1.5213, 1.5355, 1.5395
ammonium sulfate	$CuSO_4.(NH_4)_2SO_4.6H_2O$	1.4910, 1.5007, 1.5054
cesium sulfate	$CuSO_4.Cs_2SO_4.6H_2O$	1.5048, 1.5061, 1.5153
chloride (ic)	$CuCl_2.2H_2O$	1.644, 1.684, 1.742
formate	$Cu(CHO_2)_2.4H_2O$	1.4133, 1.5423, 1.5571

INORGANIC COMPOUNDS (Continued)

Name	Formula	Index
Copper oxide (ous) (cuprite)	Cu_2O	2.705
potassium chloride	$CuCl_2.2KCl.2H_2O$	1.6365, 1.6148
“ cyanide (ous)	$CuK_3(CN)_4$	1.5215
“ selenate	$CuSeO_4.K_2SeO_4.6H_2O$	1.5096, 1.5235, 1.5387
“ sulfate	$CuSO_4.K_2SO_4.6H_2O$	1.4836, 1.4864, 1.5020
strontium formate	$Cu(HCO_2)_2.2[Sr(HCO_2)_2]$ $8H_2O$	1.4995, 1.5199, 1.5801
sulfate (ic)	$CuSO_4$	1.724, 1.733, 1.739
Cyanogen	C_2N_2	1.327^{13} (liq.)
Germanium bromide, tetra-	$GeBr_4$	1.6269
Gold sodium chloride	$AuNaCl_4.2H_2O$	α1.545, γ1.75+
Hafnium oxychloride	$HfOCl_2.8H_2O$	1.557, 1.543
Ice	H_2O	1.3049, 1.3062 (A), 1.3091, 1.3104 (D), 1.3133, 1.3147 (F)
Iron ammonium chloride	$Fe(NH_4)_2Cl_4$	1.6439
ammonium selenate	$FeSeO_4.(NH_4)_2SeO_4.6H_2O$	1.5201, 1.5260, 1.5356
cesium sulfate (ic)	$FeCs(SO_4)_2.12H_2O$	1.4839
“ “ (ous)	$FeSO_4.Cs_2SO_4.6H_2O$	1.5003, 1.5035, 1.5094
rubidium sulfate	$FeRb(SO_4)_2.12H_2O$	1.48234
sulfate (ic)	$Fe_2(SO_4)_3$	1.802, 1.814, 1.818
thallium sulfate	$FeTl(SO_4)_2.12H_2O$	1.52365
Lanthanum sulfate	$La_2(SO_4)_3.9H_2O$	1.564, 1.569
Lead *ortho*arsenate, di-	$PbHAsO_4$	1.8903, 1.9097, 1.9765
nitrate	$Pb(NO_3)_2$	1.782
Lithium ammonium sulfate	$LiNH_4SO_4$	β1.437 (Li)
ammonium tartrate (*d*)	$LiNH_4(C_4H_4O_6).H_2O$	β1.567, γ1.5673
“ “ (*dl*)	$LiNH_4(C_4H_4O_6).H_2O$	β1.5287
bromide	$LiBr$	1.784
chloride	$LiCl$	1.662
dithionate	$Li_2S_2O_6.2H_2O$	1.5487, 1.5602, 1.5788
oxide	Li_2O	1.644
potassium sulfate	$LiKSO_4$	1.4723, 1.4717
“ tartrate	$LiK(C_4H_4O_6).H_2O$	β1.5226 (red)
rubidium tartrate (*a*)	$LiRb(C_4H_4O_6).H_2O$	β1.552
sodium tartrate (*dl*)	$LiNa(C_4H_4O_6).2H_2O$	β1.4904
Magnesium ammonium selenate	$MgSeO_4.(NH_4)_2SeO_4.6H_2O$	1.5070, 1.5093, 1.5169
ammonium sulfate	$Mg(NH_4)_2.(SO_4)_2.6H_2O$	1.4716, 1.4730, 1.4786
*ortho*borate	$3MgO.B_2O_3$	1.6527, 1.6537, 1.6748
cesium sulfate	$MgCs_2(SO_4)_2.6H_2O$	1.4857, 1.4858, 1.4916
chlorostannate	$MgSnCl_6.6H_2O$	1.5885, 1.5970
fluosilicate	$MgSiF_6.6H_2O$	1.3439, 1.3602
platinocyanide	$MgPt(CN)_4.7H_2O$	1.5608, 1.91
Magnesium potassium selenate	$MgK_2(SeO_4)_2.6H_2O$	1.4969, 1.4991, 1.5139
potassium sulfate	$MgK_2(SO_4)_2.6H_2O$	1.4607, 1.4629, 1.4755
rubidium sulfate	$MgRb_2(SO_4)_2.6H_2O$	1.4672, 1.4689, 1.4779
silicate	$MgSiO_3$	1.651, 1.654 (calc.), 1.660
sulfide	MgS	2.271 also 2.268
Manganese borate	$Mn_3B_4O_9$	1.617, 1.738, 1.776
cesium sulfate	$MnCs_2(SO_4)_2.6H_2O$	1.4946, 1.4966, 1.5025
chloride	$MnCl_2.4H_2O$	1.555, 1.575, 1.607
rubidium sulfate	$MnRb_2(SO_4)_2.6H_2O$	1.4767, 1.4807, 1.4907
sulfate (ous)	$MnSO_4.4H_2O$	1.508, 1.518, 1.522
“ “	$MnSO_4.5H_2O$	1.495, 1.508, 1.514
Mercury chloride (ic)	$HgCl_2$	1.725, 1.859, 1.965
cyanide (ic)	$Hg(CN)_2$	1.645, 1.492
iodide (ic) (red)	HgI_2	2.748, 2.455
Nickel ammonium selenate	$Ni(NH_4)_2.(SeO_4)_2.6H_2O$	1.5291, 1.5372, 1.5466
cesium sulfate	$NiCs_2(SO_4)_2.6H_2O$	1.5087, 1.5129, 1.5162
Nickel chloride	$NiCl_2.6H_2O$	α1.535, γ1.61
fluoride, acid	$NiF_2.5HF.6H_2O$	1.392, 1.408
potassium selenate	$NiK_2(SeO_4)_2.6H_2O$	1.5199, 1.5248, 1.5339
rubidium sulfate	$NiRb_2(SO_4)_2.6H_2O$	1.4895, 1.4961, 1.505
selenate	$NiSeO_4.6H_2O$	1.5393, 1.5125
Platinum potassium dibromonitrite	$PtK_2(NO_2)_2Br_2.H_2O$	1.626, 1.6684, 1.757
Potassium carbonate	K_2CO_3	1.426, 1.531, 1.541
carbonate, acid	$KHCO_3$	1.380, 1.482, 1.578
*per*chlorate	$KClO_4$	1.4731, 1.4737, 1.4769
chloroplatinate	K_2PtCl_6	1.827 (577 mμ)
chloroplatinite	K_2PtCl_4	1.64, 1.67
*di*chromate	$K_2Cr_2O_7$	1.7202, 1.7380, 1.8197
cyanide	KCN	1.410
fluoborate	KBF_4	1.3239, 1.3245, 1.3247
fluoride	KF	1.352 (1.361)
“	$KF.2H_2O$	1.345, 1.352, 1.363
fluosilicate	K_2SiF_6	1.3391

Zirconium ammonium fluoride	$Zr(NH_4)_3F_7$	1.433

ORGANIC COMPOUNDS

See also under Physical Constants of Organic Compounds.

Name	Index
Allontoin, solid	α1.579, γ1.660
Dimethyl thiophene (α, α'), liq	$1.51693^{13.4}$ (He)
“ “ (β, β'), liq	1.52217^{15} (He)
Ethyl carbylamine, liq	1.3659^{24}
Ethylidene cyanhydrin, liq	$1.40582^{18.4}$
Hexyl acetylene (n), liq	$1.4208^{12.5}$

MISCELLANEOUS

Albite glass	1.4890	Magdala red	1.90
Amber	1.546	Obsidian	1.482–1.496
Anorthite glass	1.5755	Paraffin	$1.43295^{38.3}$ (C)
Asphalt	1.635	Quartz, fused	1.45640 (656 mμ)
Bell metal	1.0052		1.45843 (589 mμ)
Borax, amorphous, fused	1.4630		1.46190 (509 mμ)
Canada balsam	1.530		1.47503 (361 mμ)
Ebonite	1.66 (red)		1.49634 (275 mμ)
Fuchsin	2.70		1.53386 (214 mμ)
Gelatin, Nelson's No. 1	1.530		1.57464 (185 mμ)
Gelatin, various	1.516–1.534	Resin, aloes	1.619 (red)
Gum Arabic	1.480 (1.514) (red)	colophony	1.548 (red)
		copal	1.528 (red)
Hoffman's violet	2.20	mastic	1.535 (red)
Ivory	1.539, 1.541	Peru balsam	1.593

INDEX OF REFRACTION OF ORGANIC COMPOUNDS

(See also that section of this book which contains data of Physical Constants of Organic Compounds)

The following table contains a list of organic compounds arranged in order of increasing refractive index. Measurements were made at 25°C.

Compound	n_D
Trifluoroacetic acid	1.283
2,2,2-Trifluoroethanol	1.290
Octofluoropentanol-1	1.316
Dodecafluoroheptanol-1	1.316
Methanol	1.326
Acetonitrile	1.342
Ethyl ether	1.352
Acetone	1.357
Ethyl formate	1.358
Ethanol	1.359
Methyl acetate	1.360
Propionitrile	1.363
2,2-Dimethylbutane	1.366
Isopropyl ether	1.367
2-methylpentane	1.369
Ethyl acetate	1.370
Acetic acid	1.370
Propionaldehyde	1.371
n-Hexane	1.372
2,3-Dimethylbutane	1.372
3-Methylpentane	1.374
2-Propanol	1.375
Isopropyl acetate	1.375
Propyl formate	1.375
2-Chloropropane	1.376
2-Butanone	1.377
2-Chloropropane	1.377
Methylethyl ketone	1.377
Butyraldehyde	1.378
2,4-Dimethylpentane	1.379
Propyl ether	1.379
Acetaldehyde-diethylacetal	1.379
Butylethyl ether	1.380
Nitromethane	1.380
Trifluoropropanol	1.381
2-Methylhexane	1.382

Diiodomethane	1.749

MOLAR REFRACTION OF ORGANIC COMPOUNDS

The molar refraction, R, is defined as:

$$R = \left(\frac{n^2 - 1}{n^2 + 2}\right)\left(\frac{M}{d}\right)$$

where n = refractive index; M = molecular weight; d = density in grams per cm³; and (M/d) is the volume occupied by 1 gram molecular weight of the compound. The units of R will then be cm⁻³.

R is, to a first approximation, independent of temperature or physical state, and it provides an approximate measure of the actual total volume (without free space) of the molecules in one gram mole.

For a very large number of compounds R is approximately additive for the bonds present in the molecule. Using R_D based on n_D (sodium light), the following atomic, group and structural contributions to R_D are based on Vogel's extensive modern measurements published in the Journal of the Chemical Society, 1948.

C	2.591	Cl	5.844	=S	7.921
H	1.028	Br	8.741	C≡N	5.459
=O	2.122	I	13.954	N (primary aliphatic)	2.376
>O	1.643	C_6H_5	25.463	N (secondary aliphatic)	2.582
OH	2.553	$C_{10}H_7$	43.00		
F	0.81	>S	7.729		

Ethylenic bond	1.575	Four membered ring	0.317
Acetylenic bond	1.977	Three membered ring	0.614
N (aromatic)	3.550		

Example:—For C_2H_5COOH: $R_{\text{calc.}} = 3(2.591) + 5(1.028) + 2.122 + 2.553 = 17.588$

$R_{\text{obs.}}$ for this compound is 17.51

For $C_6H_5NHCH_3$: $R_{\text{calc.}} = 25.463 + 3.550 + 2.591 + 4(1.028) = 35.716$

$R_{\text{obs.}}$ for this compound is 35.67

INDEX OF REFRACTION OF WATER

Alcohol and Carbon Bisulfide

For sodium light, λ = .5893

INDEX OF REFRACTION OF AIR (15°C, 76 cm Hg)

Corrections for reducing wavelengths and frequencies in air (15°C, 76 cm Hg) to vacuo

The indices were computed from the Cauchy formula $(n-1)10^7 = 2726.43 + 12.288/(\lambda^2 \times 10^{-8}) + 0.3555/(\lambda^4 \times 10^{-16})$. For 0°C and 76 cm Hg the constants of the equation become 2875.66, 13.412 and 0.3777 respectively, and for 30°C and 76 cm Hg 2589.72, 12.259 and 0.2576. Sellmeier's formula for but one absorption band closely fits the observations: $n^2 = 1 + 0.00057378\lambda^2/(\lambda^2 - 595260)$. If $n-1$ were strictly proportional to the density, then $(n-1)_0/(n-1)t$ would equal $1 + \alpha t$ where α should be 0.00367. The following values of α were found to hold:

λ	0.85μ	0.75μ	0.65μ	0.55μ	0.45μ	0.35μ	0.25μ
α	0.003672	0.003674	0.003678	0.003685	0.003700	0.003738	0.003872

The indices are for dry air (0.05 ± % CO_2). Corrections to reduce to dry air the indices for moist air may be made for any wavelength by Lorenz's formula, $+0.000041(m/760)$, where m is the vapor pressure in mm. The corresponding frequencies in waves per cm and the corrections to reduce wavelengths and frequencies in air at 15°C and 76 cm Hg pressure to vacuo are given. E.g., a light wave of 5000 angstroms in dry air at 15°C, 76 cm Hg becomes 5001.391 A in vacuo; a frequency of 20.000 waves per cm correspondingly becomes 19994.44.

Wave-length, λ angstroms	Dry air $(n-1) \times 10^7$ 15°C 76 cm Hg	Vacuo correction for λ in air $(n\lambda - \lambda)$ add	Frequency waves per cm $\frac{1}{\lambda}$ in air	Vacuo correction for $\frac{1}{\lambda}$ in air $\left(\frac{1}{n\lambda} - \frac{1}{\lambda}\right)$ subtract	Wave-length, λ angstroms	Dry air $(n-1) \times 10^7$ 15°C 76 cm Hg	Vacuo correction for λ in air $(n\lambda - \lambda)$ add	Frequency waves per cm $\frac{1}{\lambda}$ in air	Vacuo correction for $\frac{1}{\lambda}$ in air $\left(\frac{1}{n\lambda} - \frac{1}{\lambda}\right)$ subtract

INDEX OF REFRACTION OF AQUEOUS SOLUTIONS OF SUCROSE (CANE SUGAR)

The table gives the index of refraction for $\lambda = 0.5893$ of aqueous sugar solutions at 20°C from 0–85 % sugar. Corrections for temperatures other than 20° are given at the end of the table.

Per cent sugar	.0	.1	.2	.3	.4	.5	.6	.7	.8	.9

[1] International Temperature Correction Table, 1936, adopted by the International Commission for Uniform Methods of Sugar Analysis (Int. Sugar J. 39, 24s, 1937).

INDEX OF REFRACTION OF MALTOSE HYDRATE SOLUTIONS

McDonald: Journal of Research of the National Bureau of Standards, Vol. **46,** 165, 1951.
The following table gives the refractive index of maltose solutions for $\lambda = 5893$ A at 20° and 25°C.

Percent	n_D^{20}	n_D^{25}	Δn	$\Delta n/\Delta t$
1	1.33438	1.33389	0.00049	0.00010

Spectral Emissivity of Oxides

The emissivity of oxides and oxidized metals depends to a large extent upon the roughness of the surface. In general, higher values of emissivity are obtained on the rougher surfaces.

Material	Range of observed values	Probable value for oxide formed on smooth metal	Material	Range of observed values	Probable value for oxide formed on smooth metal
Aluminum oxide	0.22–0.40	0.30	Alumel (oxidized)	....	0.87
Beryllium oxide	0.07–0.37	0.35	Cast Iron (oxidized)	....	0.70
Cerium oxide	0.58–0.80	....	Chromel P (90Ni-10Cr) (oxidized)	....	0.87
Chromium oxide	0.60–0.80	0.70	80Ni-20Cr (oxidized)	....	0.90
Cobalt oxide	....	0.75	60Ni-24Fe-16Cr (oxidized)	....	0.83

TRANSMISSION OF CORNING COLORED FILTERS

Supplied by R. G. Saxton

If I_o is the intensity of radiation entering a layer of some medium and I the intensity reaching the opposite surface, the ratio I/I_o is called the transmittance. In practice the ratio of intensity of radiation passing through a glass sample to that incident on its surface is often measured and plotted as transmission. The transmission is the result of two factors, the transmittance of the glass and the losses by reflection. These losses amount to about 4 % for each glass-air surface; the transmission of a sample is about 92 % of its transmittance. Since the reflection losses differ slightly with different samples, the correction is often determined and applied when the transmission is measured. Values in this table have been corrected for reflection losses.

The identifying glass number, CS number, color and properties, and nominal thickness for the Corning glasses in this table are:

Glass No.	CS	Color and properties	Nominal thickness
0160	0-54	Clear; Ultraviolet transmitting	2.0
2030	2-64	Red; Sharp cut	3.0
2403	2-58	Red; Sharp cut	3.0
2404	2-59	Red; Sharp cut	3.0
2408	2-60	Red; Sharp cut	3.0
2412	2-61	Red; Sharp cut	3.0
2418	2-62	Red; Sharp cut	3.0
2424	2-63	Red; Sharp cut	3.0
2434	2-73	Red; Sharp cut	3.0

TRANSMISSION OF WRATTEN FILTERS

Compiled by Allie C. Peed, Jr. for The Eastman Kodak Company

Data condensed from Kodak Wratten Filters for Scientific and Technical Use published by the Eastman Kodak Company, manufacturers of the filters.

The following pages give (1) percentage luminous transmittance at wave lengths from 400 to 700μ at intervals of 10μ for the standard illuminant "C" adopted by the International Commission of Illumination, (2) dominant wave length in millimicrons, and (3) percentage of excitation purity. Values of wave length followed by "c" indicate the complementary wave lengths of purple filters which do not have a dominant wave length.

All colorimetric specifications are based on the 1931 standard ICI colorimetric and luminosity data.

The transmittance data are given as representing standard samples of the filters. They are intended only for the information of users in choosing filters which will meet their requirements. Values taken from the tables of data should not be used by research workers as representing precisely the absorption characteristics of a particular filter. If such precise data are needed, they should be determined for the particular filter being used.

Where the spectra extend into the ultraviolet this fact is indicated by an asterisk (*) in the transmission tables immediately beneath the filter number, and quantitative data are not given. The manufacturer should be consulted for this information. Transmission in the ultraviolet of wave lengths less than 330μ will be eliminated in the case of cemented filters, as glass absorbs ultraviolet radiation of wave lengths shorter than about 330μ.

Stability ratings are given as three letter combinations following the filter description in the table below. In establishing the stability classifications each filter is exposed to a selected light source for a specific time interval. The following grading system is used to describe the result:

Class A—stable
Class B—relatively stable
Class C—somewhat unstable
Class D—unstable

The classification letters, for example, AAA, describe the stability to the following three exposure tests in this order:

1. Two weeks' exposure to daylight in a south window
2. Twenty-four hours' exposure to a "Fade-Ometer"
3. Two weeks' exposure at two feet from a 1000-watt tungsten lamp.

Filters are supplied in two forms; as lacquered gelatin film, or as a gelatin film cemented between pieces of optical glass. Filters in glass are cemented between sheets of plane-parallel glass, which is surfaced in quantities and is of sufficient accuracy for general photographic work, and for most scientific purposes.

Most Wratten Gelatin Filters are stocked in 2- or 3-inch squares. Stocks of 2- or 3-inch square filters cemented in glass are maintained only in filters usually used for general photographic work.

The booklet "Kodak Filters and Lens Attachments" gives more valuable information on this subject.

FILTER DATA

No.	Description, use, and stability
	Colorless
0	For compensating thickness of other gelatin filters in optical systems, AAA.
1	Absorbs ultraviolet below 360 mμ, DDD.
1A	Kodak Skylight Filter—Reduces excess bluishness in outdoor color photographs in open shade under a clear, blue sky, ACA.
	Yellows
2B	Absorbs ultraviolet below 410 mμ, ACA.
3	Light yellow, CCD.
3N5	No. 3 plus 0.5 neutral density, AAA.
4	Light yellow—Approximate correction on panchromatic materials for outdoor scenes, including sky, CCC.
6	K1—Light yellow—Partial correction outdoors, BBA.
8	K2—Yellow—Full correction outdoors on Type B panchromatic materials. Widely used for proper sky, cloud, and foliage rendering. Green separation for Fluorescence Process, AAA.
8N5	No. 8 plus 0.5 neutral density, AAA.
9	K3—Deep yellow. Moderate contrast in outdoor photography (with black-and-white films), AAA.
11	X1—Greenish yellow. Correction for tungsten light on Type B panchromatic materials; also for daylight correction with Type C panchromatic materials in making outdoor portraits, darkening skies, or lightening foliage, AAA.
12	Minus blue. Haze cutting in aerial photography, AAA.
13	X2—Yellow green. Correction for Type C panchromatic materials in tungsten light, ABA.
15	G—Deep yellow. Overcorrection in landscape photography. Contrast control in copying and in aerial infrared photography, AAA.
16	Blue absorption, AAB.
18A	Transmits ultraviolet and infrared only (glass), AAA.
	Oranges and Reds
21	Blue and blue-green absorption, CBB.
22	Yellow-orange. For increasing contrast in blue preparations in microscopy. Mercury yellow, BAC.
23A	Light red. Two-color projection—contrast effects, BAB.
24	Red for two-color photography (daylight or tungsten). White-flame-arc tricolor projection, AAB.
25	A—Tricolor red for direct color separation. Contrast effects in commercial photography and in outdoor scenes. Two-color general viewing. Aerial infrared photography and haze cutting, AAA.
26	Stereo red, AAA.
29	Red color separation from transparencies and for the Kodak Fluorescence Process. Strong contrast effects. Copying blueprints. Tungsten tricolor projection, AAA.
	Magentas and Violets
30	Green absorption, BBC.
31	Green absorption, CCA.
32	Minus green, CCD.
33	Strong green absorption, CCB.
34	Violet, CDD.
34A	Blue separation—Kodak Fluorescence Process, DCC.
35	Contrast in microscopy, CDD.
36	Dark violet, CCC.
	Blues and Blue-greens
38	Red absorption, BCA.
38A	Red absorption. Increasing contrast in visual microscopy, BBB
39	Contrast control in printing motion-picture duplicates (glass) AAA.
40	Green for two-color photography (tungsten), CBC.
44	Minus red—Two-color general viewing, DDD.
44A	Minus red, DDD.
45	Contrast in microscopy, DDD.
45A	Highest resolving power in visual microscopy, CDC.
46	Blue projection (experimental), DDD.
47	Tricolor blue for direct color separation and from Kodak Ektacolor Film for Dye Transfer. Contrast effects in commercial photography. Tungsten and white-flame-arc tricolor projection BBC.
47B	Tricolor blue for color separation from transparencies and from Kodak Ektacolor Film for Graphic Arts, BBB.
48	Green and red absorption, CBC.
48A	Green and red absorption, AAB.
49	Dark blue, BCB.
49B	Very dark blue, BBB.
50	Very dark blue. Mercury violet, CCC.
	Greens
52	Light green, AAB.
53	Medium green, CCB.
54	Very dark green, AAA.
55	Stereo green, BBC.
56	Very light green, CBC.

FILTER DATA

No.	Description, use, and stability
	Greens (Continued)
57	Green for two-color photography (daylight), CBC.
57A	Light green, BBC.
58	Tricolor green for direct color separation. Contrast effects in commercial photography and microscopy, BBC.
59	Green for tricolor projection (white-flame-arc), BBB.
59A	Very light green, BBB.
60	Green for two-color photography (tungsten), BDC.
61	Green color separation from transparencies and Kodak Ekta-color Film. Tricolor projection (tungsten), ABC.
64	Red absorption (light), CDB.
65	Red absorption, ADB.
65A	Red absorption, CCD.
66	Contrast effects in microscopy and medical photography, DDC.
67A	Red absorption (light). Two-color projection, CDC.
	Narrow-band
70	Dark red. Infrared photography. Color separation for Kodak Ektacolor Film (with tungsten), ABC.
72B	Dark orange-yellow, CCC.
73	Dark yellow-green, ABB.
74	Dark green. Mercury green, BBC.
75	Dark blue-green, ACC.
76	Dark violet (compound filter), DDD.
77	Transmits 546 mμ mercury line (glass plus gelatin), AAA.
77A	Transmits 546 mμ mercury line (glass plus gelatin), AAA.
	Photometrics
78	Bluish. Photometric filter (visual), BAB.
78AA	Bluish. Photometric filter (visual), BAA.
78A	Bluish. Photometric filter (visual), AAA.
78B	Bluish. Photometric filter (visual), AAA.
78C	Bluish. Photometric filter (visual), BAA.
86	Yellowish. Photometric filter (visual), BBA.
86A	Yellowish. Photometric filter (visual), AAA.
†86B	Yellowish. Photometric filter (visual), BCA.
†86C	Yellowish. Photometric filter (visual), AAA.

No.	Description, use, and stability
	Light Balancing
80A	For Kodachrome Film, Daylight Type, and photographic flood lamps, ABA.
81	Yellowish. For warmer color rendering.
81A	Yellowish. For Kodak Ektachrome Film, Type B, with photographic flood lamps.
81B	Yellowish. For warmer color rendering.
81C	Yellowish. For Kodachrome Film, Type A, with flash lamps.
81D	Yellowish. For Kodachrome Film, Type A, with flash lamps.
81EF	Yellowish. For Kodak Ektachrome Film, Type B, with flash lamps.
82	Bluish. For cooler color rendering.
82A	Bluish. For Kodachrome Film, Type A, with 3200 K lamps.
82B	Bluish. For cooler color rendering.
82C	Bluish. For cooler color rendering.
83	Yellowish. For 16 mm Commercial Kodachrome Film and daylight exposure, BBB.
85	Orange. For Type A Kodak color films and daylight exposur BAA.
85B	Orange. For Kodak Ektachrome Film, Type B, and dayligh exposure, BAB.
	Miscellaneous
79	Photographic sensitometry. Corrects 2360 K to 5500 K, AAA.
87	For infrared photography. Absorbs visual.
87C	Absorbs visual, transmits infrared.
88A	For infrared photography. Absorbs visual.
89B	For infrared photography, AAA.
90	Narrow-band viewing filter for judging brightness scale of scenes CCD.
96	Neutral filters for controlling luminance, AAB.
97	Dichroic absorption, AAA.
102	Correction filter for Barrier-layer photocell, ABA.
106	Correction filter for S-4 type photocell, AAA.

FLUORITE

Fluorite is very transparent to the ultra-violet, nearly to 0.10μ. Coefficient of transparency at λ = 186 is found by Pflüger to be 0.80.

For the infra-red the values are given in a table below.

ROCK SALT AND SYLVINE AND FLUORITE

TRANSPARENCY FOR THE INFRA-RED.

COLORIMETRY

Selected from Judd, Jour. Opt. Soc. Amer. **23**, 359 (1933)

Recommendations of the International Commission on Illumination

Standard Illuminants

A. Gas-filled tungsten incandescent lamp of color temperature 2848° K.

B. Noon Sunlight. Lamp as above in combination with the Davis-Gibson filter for converting color temperature 2848° to 4800° K.

The filter is to be composed of a layer one centimeter thick of each of two separate solutions B_1 and B_2, contained in a double cell of colorless optical glass.

Solution B_1

Copper sulfate ($CuSO_4 \cdot 5H_2O$)	2.452	g
Mannite ($C_6H_8(OH)_6$)	2.452	g
Pyridine (C_5H_5N)	30.0	cc
Distilled water to make	1000	cc

Solution B_2

Cobalt ammonium sulfate ($CoSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$)	21.71	g
Copper sulfate ($CuSO_4 \cdot 5H_2O$)	16.11	g
Sulfuric acid (density 1.835)	10.0	cc
Distilled water to make	1000	cc

C. Average Daylight. Lamp as in **A** in combination with Davis-Gibson filter for converting color temperature 2848° to 6500° K.

The filter is composed of a layer one centimeter thick of each of two separate solutions C_1 and C_2, contained in a double cell made of colorless optical glass.

Solution C_1

Copper sulfate ($CuSO_4 \cdot 5H_2O$)	3.412	g
Mannite ($C_6H_8(OH)_6$)	3.412	g
Pyridine (C_5H_5N)	30.0	cc
Distilled water to make	1000	cc

Solution C_2

Cobalt ammonium sulfate ($CoSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$)	30.580	g
Copper sulfate ($CuSO_4 \cdot 5H_2O$)	22.520	g
Sulfuric acid (density 1.835)	10.0	cc
Distilled water to make	1000	cc

See R. Davis and K. S. Gibson Bur. Stds. Misc. Pub. No. 114, Jan. 1931 or Bur. Stds. Jour. Research **7**, 796 (1931).

Standard Coordinate System

The tristimulus system of color specification is based on four chosen stimuli consisting of homogeneous radiant energy of wave lengths

700.0 **546.1** **435.8**

mμ and of standard illuminant B (see above).

To establish the system of specification coordinates are assigned as follows:

Stimulus	x	y	z
700.0 mμ	0.73467	0.26533	0.00000
546.1 mμ	0.27376	0.71741	0.00883
435.8 mμ	0.16658	0.00886	0.82456
Standard illuminant B:	0.34842	0.35161	0.29997

The Standard Observer

The "standard observer" is determined below by the specification for the equal energy spectrum both in fractions, x, y, z of the total amount for each wave length interval of 5 mμ and directly $\bar{x}$, $\bar{y}$, $\bar{z}$. The fractional values are known as the **trilinear coordinates** or **trichromatic coefficients** of the spectrum; the direct values as the **distribution functions** or coefficients.

The sum of the trichromatic coefficients is unity, that is $x + y + z = 1$. Therefore the value of z may be and often is omitted from a specification.

Relative Visibility

The value of $\bar{y}$ given in the table is the standard visibility function or relative visibility.

Wave length mμ	Trichromatic coefficients			Distribution coefficients for equal energy			Wave length mμ
	x	y	z	$\bar{x}$	$\bar{y}$ (Rel. Vis.)	$\bar{z}$

SPECIFIC ROTATION

Specific rotation or rotatory power is given in degrees per decimeter for liquids and solutions and in degrees per millimeter for solids; + signifies right handed rotation, − left. Specific rotation varies with the wave length of light used, with temperature and, in the case of solutions, with the concentration. When sodium light is used, indicated by D in the wave length column, a value of λ = 0.5893 may be assumed.

Optical rotatory power for a large number of organic compounds will be found in the International Critical Tables, Vol. VII; for sugars, Vol. II.

SOLIDS

MAGNETIC ROTATORY POWER

The rotation of the plane of polarization of light by transparent substances subjected to a magnetic field may be applied to problems of molecular structure. This rotatory effect is known as the Faraday effect. Investigations of this effect by E. Verdet showed the angle of rotation (α) to depend on the nature of the substance and to be proportional to the length (l) of the column of the substance which the light traverses and to the strength (H) of the magnetic field. Thus

$$\alpha = \Lambda l H$$

where Λ is the Verdet constant for the experimental material.

Other symbols in the table have the following significance:

λ = Wavelength in μ
t = Degrees centigrade
ρ_M = Molecular magnetic rotation of the substance under consideration compared to that of water determined in the same apparatus in the same magnetic field.

Thus

$$\rho_M = M'\alpha'\rho'/M'\alpha'\rho$$

where M is the molecular weight, α the angle of rotation and ρ the density of the given substance, and M′, α', and ρ' are the same quantities of water.

$[\Lambda]_M^{\lambda,t}$ = Molecular rotatory value of the substance at the given temperature and at the wavelength λ. Values are in (radians)(gauss^{-1})(cm^{-1}).
$\Lambda^{\lambda,t}$ = Verdet constant at the temperature t and at the wavelength λ. Values are in (minutes)(gauss^{-1})(cm^{-1}).

Values in this table are reproduced by permission from Volume 3, Tables de Constantes et Donnees Nuimeriques, "Pouvoir Rotatorie Magnetique, Effet Magneto-Optique de Kerr."

A much greater listing of values for both organic and inorganic compounds is in the above publication.

TRANSPARENCY TO OPTICAL DENSITY CONVERSION TABLE

Transparency of a layer of material is defined as the ratio of the intensity of the transmitted light to that of the incident light. Opacity is the reciprocal of the transparency. Optical density is the common logarithm of the opacity.

Thus,

$$\text{Transparency} = \frac{I_t}{I_i}$$

$$\text{Opacity} = \frac{1}{\text{Transparency}} = \frac{I_i}{I_t}$$

$$\text{Optical density} = \log_{10}\left(\frac{I_i}{I_t}\right)$$

where I_i = Intensity of incident light
I_t = Intensity of transmitted light.

DENSITY OF VARIOUS SOLIDS

The approximate density of various solids at ordinary atmospheric temperature.
In the case of substances with voids such as paper or leather the bulk density is indicated rather than the density of the solid portion.

(Selected principally from the Smithsonian Tables.)

Substance	Grams per cu. cm	Pounds per cu. ft.
Agate	2.5–2.7	156–168
Alabaster, carbonate	2.69–2.78	168–173
sulfate	2.26–2.32	141–145
Albite	2.62–2.65	163–165
Amber	1.06–1.11	66–69

WEIGHT OF ONE GALLON OF WATER (U.S. GALLONS)

The weights are for dry air at the same temperature as the water up to 40°C and at a barometric pressure corrected to 760 mm and against brass weights of 8.4 density at 0°C. Above 40°C the temperature of the air is assumed to be 20°C, i.e., the water is allowed to cool to 20°C prior to the weighings being made. The volumetric computations are based upon the relations that one liter = 1 dm^3 and that 1 dm^3 = 61.023744 $in.^3$.

Temperature (°C)	Weight in vacuo (g)	Weight in vacuo (lb)	Weight in air (g)	Weight in air (lb)

TEMPERATURE CORRECTION FOR VOLUMETRIC SOLUTIONS

This table gives the correction to various observed volumes of water, measured at the designated temperatures to give the volume at the standard temperature, 20°C. Conversely, by subtracting the corrections from the volume desired at 20°C., the volume that must be measured out at the designated temperatures in order to give the desired volume at 20°C., will be obtained. It is assumed that the volumes are measured in glass apparatus having a coefficient of cubical expansion of 0.000025 per degree centigrade. The table is applicable to dilute aqueous solutions having the same coefficient of expansion as water.

Temperature of measurement, °C.	Capacity of apparatus in milliliters at 20°C.						
	2,000	1,000	500	400	300	250	150
	Correction in milliliters to give volume of water at 20°C.						
15	+1.54	+0.77	+0.38	+0.31	+0.23	+0.19	+0.12
16	+1.28	+ .64	+ .32	+ .26	+ .19	+ .16	+ .10
17	+ .99	+ .50	+ .25	+ .20	+ .15	+ .12	+ .07
18	+ .68	+ .34	+ .17	+ .14	+ .10	+ .08	+ .05
19	+ .35	+ .18	+ .09	+ .07	+ .05	+ .04	+ .03
21	− .37	− .18	− .09	− .07	− .06	− .05	− .03
22	− .77	− .38	− .19	− .15	− .12	− .10	− .06
23	−1.18	− .59	− .30	− .24	− .18	− .15	−.09
24	−1.61	− .81	− .40	− .32	− .24	− .20	−.12
25	−2.07	−1.03	− .52	− .41	− .31	− .26	−.15
26	−2.54	−1.27	− .64	− .51	− .38	− .32	−.19
27	−3.03	−1.52	− .76	− .61	− .46	− .38	−.23
28	−3.55	−1.77	− .89	− .71	− .53	− .44	−.27
29	−4.08	−2.04	−1.02	− .82	− .61	− .51	−.31
30	−4.62	−2.31	−1.16	− .92	− .69	− .58	−.35

In using the above table to correct the volume of certain standard solutions to 20°C. more accurate results will be obtained if the numerical values of the corrections are increased by the percentages given below:

Solution	Normality N	Normality N/2	Normality N/10
HNO_3	50	25	6
H_2SO_4	45	25	5
NaOH	40	25	5
KOH	40	20	4

TEMPERATURE CORRECTION FOR GLASS VOLUMETRIC APPARATUS

This table gives the correction to be added to actual capacity (determined at certain temperatures) to give the capacity at the standard temperature, 20°C. Conversely, by subtracting the corrections from the indicated capacity of an instrument standard at 20°C. the corresponding capacity at other temperatures is obtained. The table assumes for the cubical coefficient of expansion of glass 0.000025 per degree centigrade. The coefficients of expansion of glasses used for volumetric instruments vary from 0.000023 to 0.000028.

Temperature in degrees C.	2,000 ml	1,000 ml	500 ml	400 ml	300 ml	250 ml
15	+0.25	+0.12	+0.06	+0.05	+0.04	+0.031

HYDROMETERS AND DENSITY UNITS

Alccholometer. — For testing alcoholic solutions; the scale shows the per cent of alcohol by volume; 0°–100° is the per cent

Ammoniameter. — For testing ammonia solutions; scale 0°–40°; to convert to sp. gr. multiply by 3 and deduct from 1000.

Barktrometer or *Barkometer.* — For testing tanning liquor; scale 0°–80° Bk; the number to the right of the decimal point of the sp. gr. is the degree Bk; thus, 1.025 sp. gr. is 25° Bk.

Baumé. — There are two kinds in use; heavy Bé, for liquids heavier than water and light Bé for liquids lighter than water. In the former, 0° corresponds to a sp. gr. 1.000 (water at 4°C.) and 66° corresponds to a sp. gr. 1.842; in the lighter than water scale, 0° Bé is equivalent to the gravity of a 10% solution of sodium chloride and 60° Bé corresponds to a sp. gr. of 0.745. For Baumé degrees on the scale of densities greater than unity, the following equation gives the means of conversion:

$$\text{Sp. gr.} = \frac{m}{m - d}$$

where m = 145 (in the United States)
m = 144 (old scale used in Holland)
m = 146.78 (New scale or Gerlach scale)
d = Baumé reading

Beck's Hydrometer has 0° corresponding to sp. gr. 1.000 and 30° to sp. gr. 0.850; equal divisions on the scale are continued as far as required in both directions.

Brix Saccharometer or *Balling Saccharometer* shows directly the per cent of sugar (sucrose) by weight at the temperature indicated on the instrument, usually 17.5°C.; i.e., degrees Brix is the per cent sugar.

Cartier's Hydrometer floats in water at the 10° scale division and at 30° corresponds to 32° Bé.

Oleometer.—For vegetable and sperm oils; scale 50°–0° corresponds to sp. gr. 0.870–0.970.

Soxhlet's Lactometer, for determining the density of milk, has a scale from 25° (sp. gr. 1.025) to 35° (sp. gr. 1.035) divided into suitable scale divisions.

Twaddell Hydrometers have the scale so arranged that the reading multiplied by 5 and added to 1000 gives the sp. gr. with reference to water as 1000; it is always used for densities greater than water.

HYDROMETER CONVERSION TABLES

Equations:

$$\rho/\text{kg m}^{-3} = (999.83952 + 16.945176\,t - 7.9870401 \times 10^{-3}\,t^2 - 46.170461 \times 10^{-6}\,t^3 + 105.56302 \times 10^{-9}\,t^4 - 280.54253 \times 10^{-12}\,t^5)/(1 + 16.879850 \times 10^{-3}\,t) \tag{1}$$

$$10^6\,\kappa_T/\text{bar}^{-1} = (50.88496 + 0.6163813\,t + 1.459187 \times 10^{-3}\,t^2 + 20.08438 \times 10^{-6}\,t^3 - 58.47727 \times 10^{-9}\,t^4 + 410.4110 \times 10^{-12}\,t^5)/(1 + 19.67348 \times 10^{-3}\,t) \tag{2}$$

$$10^6\,\kappa_T/\text{bar}^{-1} = (50.884917 + 0.62590623\,t + 1.3848668 \times 10^{-3}\,t^2 + 21.603427 \times 10^{-6}\,t^3 - 72.087667 \times 10^{-9}\,t^4 + 465.45054 \times 10^{-12}\,t^5)/(1 + 19.859983 \times 10^{-3}\,t) \tag{3}$$

$$\kappa_S = (\partial \ln \rho/\partial P)_S = \frac{1}{\rho U^2} \tag{4}$$

---

* Density ρ, thermal expansivity $\alpha = -(\partial \ln \rho/\partial T)_p$, and isothermal compressibility $\kappa T = (\partial \ln \rho/\partial p)T$. For purposes of this table, ordinary water is that with a maximum density of 999.972 kg m^{-3}. Equation 4 for the compressibility should be used for temperatures $0 < t < 100$°C, and Equation 3 for $100 < + < 150$°C. The liquid is metastable below 0°C and above 100°C. Values below 0°C were obtained by extrapolation, and no claim is made for their accuracy.

DENSITY OF MOIST AIR

The density of dry air may be determined by computation from the general relation $D = D_0(T_0/T)(P/P_0)$ where D_0 represents a known density at absolute temperature T_0 and pressure P_0 and D, the density at absolute temperature T and pressure P.

The density of **moist** air may be determined by a similar relation:

$D = 1.2929\ (273.13/T)\ [(B - 0.3783e)/760]$ where T is the absolute temperature; B, the barometric pressure in mm, and e the vapor pressure of the moisture in the air in mm. The density will then be the product of two terms, each of which may be found by use of the tables which follow.

The **first factor,** $1.2929\ (273.13/T)$, may be found directly in Table I for various temperatures. For convenience, temperatures are given in the table in °C although the values of the factor have been computed with absolute temperatures. The tabular values actually represent the density of dry air at various temperatures and 760 mm pressure.

The **second factor,** $[(B - 0.3783e)/760]$, must be obtained in two steps: **First**—the numerator of the expression is obtained by subtracting $0.3783e$ from the barometric pressure. The quantity $0.3783e$ may be found directly from the dew point in Table II. If the wet and dry bulb thermometer readings are known e may be found in the table Reduction of Psychrometric Observations given in the section Hygrometric and Barometric Tables. $0.3783e$ may then be found by calculation or read from the table. **Second**—the value of the whole factor for any value of $B - 0.3783e$ may be obtained from Table III.

The product of the above two factors will give the required density in g/l

To facilitate obtaining **approximate values** of the density for ordinary pressures and temperatures, a table of products is given which may be entered with the temperature in °C and the corrected (for moisture) value of the barometric pressure in mm to obtain density.

As an illustration of the use of the tables, let it be desired to find the density of air for a barometric pressure of 750 mm, a dew point of 10° C, and air temperature of 20° C.

From the dew point, the value of $0.3783e$ is found in Table II to be 3.48 mm. $750 - 3.48 = 746.52$, the corrected pressure. The pressure factor for this value found in Table III by interpolation is 0.98226.

The temperature factor from Table I is 1.2047.

$$1.2047 \times 0.98224 = 1.1833 \text{ g/l.}$$

To obtain the value directly from Table IV, enter it for 20° C and 746.5 mm which gives by interpolation 1.183 g/l.

TABLE I

(1.2929 × 273.13/*T*)

(Besides being a necessary part of the determination of the density of moist air, the values in this table are actually the density of dry air in g/l at 760 mm pressure for various temperatures.)

TABLE III

Pressure Factor.—[$(B - 0.3783e)/760$]

The figures in the body of the table give values of the whole term $(B - 0.3783e)/760]$ for various values of the numerator $(B - 0.3783e)$ expressed at the left and top.

TABLE IV

Density of Moist Air

Values in the body of the table give the density of moist air in g/l for a limited range of temperatures and corrected pressure values ($B - 0.3783e$). The latter may be obtained by use of Table II.

From NASA Technical Note D-7488 by David J. Poferl and Roger Svehla (1973). The following three tables list the thermodynamic and transport properties of air over the temperature range of 300-2800K at pressures of 20, 30, and 40 atm. Factors for converting viscosity, specific heat at constant pressure, thermal conductivity, and enthalpy from cgs units to SI and English units are

Viscosity:

$$1\,\frac{\text{g}}{(\text{cm})(\text{sec})} = 0.1\,\frac{(\text{N})(\text{sec})}{\text{m}^2}$$

$$= 6.72\text{x}10^{-2}\,\frac{\text{lbm}}{(\text{ft})(\text{sec})}$$

$$= 241.9\,\frac{\text{lbm}}{(\text{ft})(\text{hr})}$$

$$= 2.089\text{x}10^{-3}\,\frac{(\text{lbf})(\text{sec})}{\text{ft}^2}$$

Thermal conductivity:

$$1\,\frac{\text{cal}}{(\text{cm})(\text{sec})(\text{K})} = 418.4\,\frac{\text{W}}{(\text{m})(\text{K})}$$

$$= 0.8064\,\frac{\text{Btu}}{(\text{ft})^2(\text{sec})(^\circ\text{F/in.})}$$

$$= 6.72\text{x}10^{-2}\,\frac{\text{Btu}}{(\text{ft}^2)(\text{sec})(^\circ\text{F/ft})}$$

$$= 241.9\,\frac{\text{Btu}}{(\text{ft})^2(\text{hr})(^\circ\text{F/ft})}$$

Specific heat at constant pressure:

$$1\,\frac{\text{cal}}{(\text{g})(\text{K})} = 4.184\,\frac{\text{J}}{(\text{g})(\text{K})}$$

$$= 1\,\frac{\text{Btu}}{(\text{lbm})(^\circ\text{F})}$$

Enthalpy:

$$1\,\frac{\text{cal}}{\text{g}} = 4.184\,\frac{\text{J}}{\text{g}}$$

$$= 1.8\,\frac{\text{Btu}}{\text{lbm}}$$

ISOTHERMAL COMPRESSIBILITY OF LIQUIDS

J. C. McGowan

The figures in this table are for isothermal compressibilities in cgs units. The compiler suggests that, provided the pressure is not too high, the reciprocal of the isothermal compressibility varies linearly with the pressure. This suggestion also appears in papers by J. R. Macdonald, *Rev. Mod. Phys.*, 38, 669, 1966, and O. L. Anderson, *J. Phys. Chem. Solids*, 27, 547, 1966. The papers vary somewhat as to how far this linearity persists.

		Isothermal compressibility × 10^{10} $m^2 N^{-1}$		
Liquid	Temp., °C^a	At 1 atm (or 1.013 × 10^5 Nm^2)	At 1000 atm (or 1.013 × 10^8 Nm^3)	Ref.

COEFFICIENT OF FRICTION

Compiled by Harold Minshall

The coefficient of friction between two surfaces is the ratio of the force required to move one over the other to the total force pressing the two together. If F is the force required to move one surface over another and W, the force pressing the surfaces together, the coefficient of friction,

$$\mu = \frac{F}{W}$$

Materials	Condition	Temperature °C	μ (Static)
A. STATIC FRICTION			
Non Metals

[2] Hemispherical steel slider having 0.6 cm. diameter. The thin, 10^{-3} to 10^{-4} cm., thin metallic films were deposited on various substrates as indicated. Amonton's Law is not obeyed in this case.

[3] The metals which were spectroscopically pure were outgassed in a vacuum prior to other gases being admitted. When clean and in vacuum there is gross seizure.

Serpentine	3–4
Silicon	7.0
Silver	2.5–4
Silver chloride	1.3
Sodium	0.4
Steel	5–8.5
Stibnite	2
Strontium	1.8
Sulfur	1.5–2.5
Talc	1
Tellurium	2.3
Tin	1.5–1.8
Topaz	8
Tourmaline	7.3
Wax (0°)	0.2
Wood's metal	3
Zinc	2.5

COMPARISON OF HARDNESS VALUES OF VARIOUS MATERIALS ON MOHS AND KNOOP SCALES*

Compiled by Laurence S. Foster

Substance	Formula	Mohs value	Knoop value
Talc	$3MgO \cdot 4SiO_2 \cdot H_2O$	1	
Gypsum	$CaSO_4 \cdot 2H_2O$	2	32
Cadmium	Cd	..	37
Silver	Ag	..	60
Zinc	Zn	..	119
Calcite	$CaCO_3$	3	135
Fluorite	CaF_2	4	163
Copper	Cu	..	163
Magnesia	MgO	..	370
Apatite	$CaF_2 \cdot 3Ca_3(PO_4)_2$	5	430
Nickel	Ni	..	557
Glass (soda lime)	....	..	530
Feldspar (orthoclase)	$K_2O \cdot Al_2O_3 \cdot 6SiO_2$	6	560
Quartz	SiO_2	7	820
Chromium	Cr	..	935
Zirconia	ZrO_2	..	1160
Beryllia	BeO	..	1250
Topaz	$(AlF)_2SiO_4$	8	1340
Garnet	$Al_2O_3 \cdot 3FeO \cdot 3SiO_2$	..	1360
Tungsten carbide alloy	WC, Co	..	1400–1800
Zirconium boride	ZrB_2	..	1550
Titanium nitride	TiN	9	1800
Tungsten carbide	WC	..	1880
Tantalum carbide	TaC	..	2000
Zirconium carbide	ZrC	..	2100
Alumina	Al_2O_3	..	2100
Beryllium carbide	Be_2C	..	2410
Titanium carbide	TiC	..	2470
Silicon carbide	SiC	..	2480
Aluminum boride	AlB	..	2500
Boron carbide	B_4C	..	2750
Diamond	C	10	7000

* Acknowledgment is made to N. W. Thibault, Norton Company, Worcester, Massachusetts, for many of Knoop hardness values. *Cf.* R. F. Geller, "A Study of Ceramics for Nuclear Reactors," Nucleonics, Vol. 7, No. 4, Table 1, pp. 8–9 (Oct. 1950). V. E. Lysaght, *Indentation Hardness Testing*, Reinhold 1949.

SURFACE TENSION OF LIQUID ELEMENTS

Gernot Lang

The following data were collected from many sources. As a result their accuracy varies. Users of data in this table are advised that:

1. As a rule, results from the "sessile drop" and "maximum bubble pressure" as well as from the "pendant drop" methods are preferable to results obtained from other methods for metals with very high melting points.
2. Values of single measurements are usually not as well supported by experiments as those of serial measurements at various temperatures.
3. Values in parentheses can be considered improbable.

Element	Purity (wt.%)	σ_{mp} (dyn/cm)	Atm.	σ_{t1}		σ_{t2}		σ_{t3}		Method	Ref.

Viscosity.—All fluids possess a definite resistance to change of form and many solids show a gradual yielding to forces tending to change their form. This property, a sort of internal friction, is called viscosity; it is expressed in dyne-seconds per cm² or poises. Dimensions,—$[m\, l^{-1}\, t^{-1}]$. If the tangential force per unit area, exerted by a layer of fluid upon one adjacent is one dyne for a space rate of variation of the tangential velocity of unity, the viscosity is one poise.

Kinematic viscosity is the ratio of viscosity to density. The c. g. s. unit of kinematic viscosity is the **stoke.**

Flow of liquids through a tube; where l is the length of the tube, r its radius, p the difference of pressure at the ends, η the coefficient of viscosity, the volume escaping per second,

$$v = \frac{\pi p r^4}{8 l \eta} \text{ (Poiseuille).}$$

The volume will be given in cm³ per second if l and r are in cm, p in dynes per cm² and η in poises or dyne-seconds per cm².

VISCOSITY OF WATER BELOW 0°C

White-Twining 1914

Temperature	Viscosity centipoises	Temperature	Viscosity centipoises
0°C	1.798	−7.23	2.341
−2.10	1.930	−8.48	2.458
−4.70	2.121	−9.30	2.549
−6.20	2.250		

ABSOLUTE VISCOSITY OF WATER AT 20°C

Swindells, J. R. Coe, Jr., and T. B. Godfrey, Journal of Research, National Bureau of Standards **48,** 1, 1952.

The value found for the viscosity of water at 20°C was 0.010019 ± 0.000003 poise.

The value **0.01002** poise is to be used as the absolute value of the viscosity of water for calibration purposes.

VISCOSITY CONVERSION TABLE

Poise = c.g.s. unit of absolute viscosity = $\frac{\text{gm}}{\text{sec} \times \text{cm}}$

Stoke = c.g.s. unit of kinematic viscosity = $\frac{\text{gm}}{\text{sec} \times \text{cm} \times \text{density}_{(t°F)}}$

Centipoise = 0.01 poise

Centistoke = 0.01 stoke

Centipoises = Centistokes × density (at given temperature)

To convert poises to $\frac{\text{lb}}{\text{sec} \times \text{ft}}$ or $\frac{\text{lb}}{\text{hr} \times \text{ft}}$ multiply by 0.0672 or 242 respectively.

Centistokes	Saybolt Seconds at			Redwood Seconds at			Engler Degrees at all temps.

90.0	415.8	416.6	418.7	364.4	367.4	375.0	11.84
*100.0	462.0	462.9	465.2	404.9	408.2	416.7	13.16

* At higher values use the same ratio as above for 100 centistokes; e.g., 110 centistokes = 110 × 4.620 Saybolt seconds at 100°F.

To obtain the Saybolt Universal viscosity equivalent to a kinematic viscosity determined at t°F, multiply the equivalent Saybolt Universal viscosity at 100°F by $1 + (t - 100)0.000064$; e.g., 10 centistokes at 210°F are equivalent to 58.8 × 1.0070, or 59.2 Saybolt Universal seconds at 210°F.

24	.9111	50	.5468	76	.3732		
25	.8904	51	.5378	77	.3684		

The above table was calculated from the following empirical relationships derived from measurements in viscometers calibrated with water at 20°C (and one atmosphere), modified to agree with the currently accepted value for the viscosity at 20° of 1.002 cp:

$$0^\circ \text{ to } 20^\circ\text{C}: \log_{10} \eta_T = \frac{1301}{998.333 + 8.1855(T-20) + 0.00585(T-20)^2} - 3.30233$$

(R. C. Hardy and R. L. Cottington, J.Res.NBS *42*, 573 (1949).)

$$20^\circ \text{ to } 100^\circ\text{C}: \log_{10} \frac{\eta_T}{\eta_{20}} = \frac{1.3272(20-T) - 0.001053(T-20)^2}{T + 105}$$

(J. F. Swindells, NBS, unpublished results.)

DIFFUSION COEFFICIENTS IN AQUEOUS SOLUTIONS AT 25°

The diffusion coefficient D may be defined by either of the equations

$$J = -D \frac{\partial c}{\partial x}$$

or

$$\frac{\partial c}{\partial t} = D \frac{\partial^2 c}{\partial x^2}$$

when diffusion occurs in the x-direction only. Here J is the diffusion-flux across unit area normal to the x-direction, $\frac{\partial c}{\partial x}$ is the concentration-gradient at a fixed time, $\frac{\partial c}{\partial t}$ is the rate of change of concentration with time at a fixed distance. If J is expressed in mole cm^{-2} sec^{-1} and c in mole cm^{-3}, x in cm, and t in sec, D will be given in units of cm^2 sec^{-1}. In general D varies somewhat with concentration. The values below are a selection from measurements by modern high-precision methods, mainly by H. S. Harned and collaborators, R. H. Stokes and collaborators, L. J. Gosting and collaborators, and L. G. Longsworth.

For strong electrolytes at infinite dilution, limiting diffusion coefficients may be calculated by the Nernst relation:

$$D = \frac{RT}{F^2}\left[\frac{(\nu_1 + \nu_2)(\lambda_1^0 \lambda_2^0)}{\nu_1 |Z_1| (\lambda_1^0 + \lambda_2^0)}\right]$$

where R = gas constant, F = Faraday, T = absolute temperature, λ_1^0 and λ_2^0 are cation and anion limiting equivalent conductances, ν_1 and ν_2 are the numbers of cations and anions formed from one "molecule" of electrolyte, and Z_1 is the cation valency. Concentrations, unless expressed otherwise are as molarities and the diffusion coefficients are expressed as $10^5 D/cm^2\ sec^{-1}$ at 25°C.

RADIOACTIVE TRACER DIFFUSION DATA FOR PURE METALS

John Askill

The data in these tables are the most reliable set of radioactive tracer diffusion data for pure metals published in the literature from 1938 through December, 1970. For a complete listing of all published data on this subject up to December 1968 see "Tracer Diffusion Data for Metals, Alloys and Simple Oxides" by John Askill, published by Plenum Press, New York, 1970.

The diffusion coefficient D_T at a temperature T(°K) is given by the following relation:

$$D_T = D_0 e^{-Q/RT}$$

Abbreviations used in the tables are:

A.R.G. = Autoradiography
R.A. = Residual Activity
S.D. = Surface Decrease
S.S. = Serial Sectioning
P. = Polycrystalline
S. = Single Crystal
⊥c. = Perpendicular to c Direction
∥c. = Parallel to c Direction
99.95 = 99.95%

VISCOSITY AND THERMAL CONDUCTIVITY OF OXYGEN AS A FUNCTION OF TEMPERATURE

Conversion Factors

T, °K → T, °F: multiply by (9/5) then subtract 459.67
T, °K → T, °C: subtract 273.15
T, °K → T, °R: multiply by (9/5)
P, atm → P, psia: multiply by 14.69595
P, atm → p, N/m^2: multiply by 1.01325 × 10^5
η, g/cm-s → η, N-s/m^2
η, g/cm-s → η, lb$_m$/ft-s
λ, W/m-°K → λ, cal/cm-s-°K
λ, W/m-°K → λ, Btu ft-hr-°R

Temperature, °K	Viscosity, g/cm-s $10^3 \eta_0$	Thermal conductivity, W/m-K $10^3 \lambda_0$

From Hanley, H. J. M., McCarty, R. D., and Sengers, J. V., *Viscosity and Thermal Conductivity Coefficients of Gaseous and Liquid Oxygen,* NASA CR-2440, National Aeronautics and Space Administration, Washington, D.C., August 1974 (available from National Technical Information Service, Springfield, Va. 22151).

THERMAL CONDUCTIVITY OF COMPRESSED OXYGEN

In this table, thermal conductivity, λ, is in the unit milliwatt/m-K.

Conversion Factors

T, °K → T, °F: multiply by (9/5) then subtract 459.67
T, °K → T, °C: subtract 273.15
T, °K → T, °R: multiply by (9/5)
P, atm → P, psia: multiply by 14.69595
P, atm → P, N/m^2: multiply by 1.01325×10^5
η, g/cm-s → η, Ns/m^2: multiply by 10^{-1}
η, g/cm-s → η, lb_m/ft-s: multiply by 0.0671969
λ, W/m-K → λ, cal/cm-s-K: multiply by (1/418.4)
λ, W/m-K → λ, Btu/ft-hr-°R: multiply by 0.578176

V., *Viscosity and Thermal Conductivity Coefficients of Gaseous and Liquid Oxygen,* NASA CR-2440, National Aeronautics and Space Administration, Washington, D.C., August 1974 (available from National Technical Information Service, Springfield, Va. 22151).

TRANSPORT PROPERTIES OF OXYGEN AT SATURATION

Conversion Factors

T, °K → T, °F: multiply by (9/5) then subtract 459.67
T, °K → T, °C: subtract 273.15
T, °K → T, °R: multiply by (9/5)
P, atm → P,psia: multiply by 14.69595
P, atm → P, N/m^2: multiply by 1.01325 × 10^5
η, g/cm-s → η, Ns/m^2: multiply by 10^{-1}
η, g/cm-s → η, lb$_m$/ft-s: multiply by 0.0671969
λ, W/m-K → λ, cal/cm-s-K: multiply by (1/418.4)
λ, W/m-K → λ, Btu/ft-hr-°R: multiply by 0.578176

PHYSICAL CONSTANTS OF CLEAR FUSED QUARTZ

Based on information contained in Fused Quartz Catalogue Q-7A General Electric Company.

Property		Clear fused quartz
Density		2.2 g./c.c.
Hardness		4.9 (Mohs')
Tensile Strength		7,000 p.s.i.
Compressive Strength		>160,000 p.s.i.
Bulk Modulus	(approx.)	5.3 × 10^6 p.s.i.
Rigidity Modulus		4.5 × 10^6 p.s.i.
Young's Modulus		10.4 × 10^6 p.s.i.
Poisson's Ratio		.16
Coefficient of Thermal Expansion	(av.)	5.5×10^{-7} cm./cm./°C $\left\{\begin{matrix}20°\text{C}\\320°\text{C}\end{matrix}\right.$
Thermal Conductivity		.0033 g. cal./cm.^{2}/sec./°C/cm.
Specific Heat		.18 g. cal./gm.
Softening Point	(approx.)	1665°C

Property		Clear fused quartz
Annealing Point	(approx.)	1140°C
Strain Point		1070°C
Electrical Resistance		9.5 $\log_{10}$ R for cm.^{3} at 350°C
Dielectric Constant		3.75 at 20°C. 1 Mc.
Dielectric Loss Factor	less than	.0004 at 20°C. 1 Mc.
Dissipation Factor	less than	.0001 at 20°C. 1 Mc.
Index of Refraction		1.4585
Velocity of Sound—Shear Wave		3.75 × 10^5 cm./sec.
Velocity of Sound—Compressional Wave		5.90 × 10^5 cm./sec.
Sonic Attenuation	less than	.033 db/ft./mc.

FIXED POINT PROPERTIES OF OXYGEN

From NASA SP-3071, "ASRDI Oxygen Technology Survey, Thermophysical Properties", Volume I (1972), edited by Hans M. Roder and Lloyd A. Weber. This NASA publication contains an extensive bibliography and a discussion of basis for selection of these data for oxygen. The publication is available from the National Technical Information Service, Springfield, Virginia 22151.

FIXED POINTS AND PHASE EQUILIBRIUM BOUNDARIES FOR PARAHYDROGEN

a. Triple point

$P_t = 0.0704$ bar
$T_t = 13.803$ K
ρ_t (liquid) = 38.21 mol/ℓ

b. Normal boiling point

$P_b = 1.01325$ bar
$T_b = 20.268$ K
ρ_b (liquid) = 35.11 mol/ℓ
ρ_b (gas) = 0.6636 mol/ℓ

c. Critical point

$P_c = 12.928$ bar
$T_c = 32.976$ K
$\rho_c = 15.59$ mol/ℓ

Note: Some data indicate that the true critical temperature is probably closer to 32.93 K. However, that value is pending further verfication.

d. Melting pressures: in atmospheres

$$P = P_t + (T - T_t)\,[A_1 e^{-\alpha/T} + A_2 T]$$

$A_1 = 30.3312$
$A_2 = 0.6667$
$\alpha = 5.693$

e. Liquid-vapor coexistence densities

Liquid, density in mol/cm³ :

$$\rho \text{ sat } \ell = \rho_c + A_1(\Delta T)^{0.380} + A_2(\Delta T) + A_3(\Delta T)^{4/3} + A_4(\Delta T)^{5/3} + A_5(\Delta T)^2$$

$A_1 = 7.323\,4603 \times 10^{-3}$
$A_2 = -4.407\,4261 \times 10^{-4}$
$A_3 = 6.620\,7946 \times 10^{-4}$
$A_4 = -2.922\,6363 \times 10^{-4}$
$A_5 = 4.008\,4907 \times 10^{-5}$
$\Delta T = T_c - T$

Vapor $T_b \leqslant T \leqslant T_c$, density in mol/cm³ :

$$\rho \text{ sat } G = \rho_c + A_1(\Delta T)^{0.370} + A_2(\Delta T) + A_3(\Delta T)^{0.7} + A_4(\Delta T)^{0.8}$$

$A_1 = -7.196\,7724 \times 10^{-3}$
$A_2 = 1.449\,5527 \times 10^{-3}$
$A_3 = 3.240\,3120 \times 10^{-3}$
$A_4 = -4.464\,0177 \times 10^{-3}$

f. Vapor pressure: in atmospheres

For $T \leqslant 29$ K:

$$\log_{10} P_a = A_1 + \frac{A_2}{T + A_3} + A_4 T$$

$A_1 = 2.000\,620$
$A_2 = -50.09\,708$
$A_3 = 1.0044$
$A_4 = 1.748\,495 \times 10^{-2}$

For $T > 29$ K:

$$P = P_a + A_5(T - 29)^3 + A_6(T - 29)^5 + A_7(T - 29)^7$$

$A_5 = 1.317 \times 10^{-3}$
$A_6 = -5.926 \times 10^{-5}$
$A_7 = 3.913 \times 10^{-6}$

From Weber, L. A., Thermodynamic and Related Properties of Parahydrogen from the Triple Point to 300 K at Pressures to 1000 Bar, NASA SP-3008, NBSIR 74-374, 1975.

NOTES: (a) From plotted data.

(b) Epstein equation: $d_t = 0.9514 - 2.392 \times 10^{-4}\, t°\text{C}$.

(c) Thomson and Garelis: $d_t = 0.9490 - 22.3 \times 10^{-5} t°\text{C} - 1.75 \times 10^{-8} t^2 °\text{C}$.

(d) Formula to calculate density: $V = M_K \cdot V_K + M_{Na} \cdot V_{Na}$ (where V, V_K and V_{Na} are the specific volumes (reciprocal of density) of the alloy, K and Na respectively, M_K and M_{Na} the mole fraction of the elements).

(e) Extrapolated by calculation, Epstein equation:

$$K = \frac{2.433 \times 10^{-2}(t + 273.16)}{6.8393 + 3.3873 \times 10^{-2} t + 1.7235 \times 10^{-5} t^2}$$

(f) Epstein equation: $r_t = 10.892 + 0.015272t + 3.6746 \times 10^{-5} t^2 - \frac{379.26}{t}$.

(g) Formula to calculate heat capacity: $C = W_{Na} \cdot C_{Na} + W_K \cdot C_K$ (where C, C_{Na} and C_K are the heat capacity of the alloy, Na and K respectively, W_{Na} and W_{Ka} the weight fractions of Na and K respectively in the alloy).

(h) 150°C.

MECHANICAL AND PHYSICAL PROPERTIES OF WHISKERS

From NASA SP-5055

This table lists some nominal values for physical and mechanical properties of some whiskers. The strength of whiskers is influenced by temperature, time, surface conditions, surface films or corrosion, crystallographic orientation, impurities and testing techniques.

OPAQUE WHITE PIGMENTS

Pigment Name and Chemical Composition[1]	Specific Gravity[2]	Particle Characteristics[3]	Refractive Index[4]
Titanium calcium white, TiO_2 (25%) + $CaSO_4$ (75%)	3.10	prism. or ragged gr.	mostly 1.8–2.0 (irr.) (bi.) [M*]
Titanium dioxide (rutile) + $CaSO_4$	3.25	. . .	Av. 1.98 [TPC]
Titanium barium white, TiO_2 (25%) + $BaSO_4$ (75%)	4.30	min. round. gr.	$n_{\Sigma c}$ 1.7–2.5 [M*]
White lead (basic sulfate) $PbSO_4 \cdot PbO$	6.46	. . .	Av. 1.93 [TPC]
Lithopone	4.3	. . .	Av. 1.84 [TPC]
Lithopone (regular), ZnS (28–30%), $BaSO_4$ (72–70%)	4.30	fine comp. gr.	2.3 (ZnS)–1.64 ($BaSO_4$) [M]
Zinc white (ordinary), ZnO	5.65	v. fine cryst. gr.	ϵ2.02, ω2.00 [M]
(acicular), ZnO	. . .	spicules, fourlets	ϵ2.02, ω2.00 [M*]
White lead (basic carbonate), $2PbCO_3 \cdot Pb(OH)_2$	6.70	v. fine cryst.	ϵ1.94, ω2.09 [M]
Antimony oxide, Sb_2O_3	5.75	v. fine cryst.	valentinite, α2.18, γ and β2.35 [LB, M*] senarmonite, 2.09 (isot.)
Zirconium oxide (baddeleyite), ZrO_2	5.69	. . .	χ2.13, γ2.20, β2.19 [LB], Av. 2.40 [TPC]
Titanium dioxide (anatase), TiO_2	3.9	min. round. gr.	ϵ and ω 2.5 (w. bi.) [M*]
(rutile), TiO_2	4.2	round. or prism. gr.	ϵ2.9, ω2.6 [M*]

TRANSPARENT WHITE PIGMENTS†

Diatomaceous earth, SiO_2	2.31	min. fossil forms	n mostly 1.435, some 1.40 [M*]
Aluminum stearate, $Al(C_{18}H_{35}O_2)_3$	0.99	agg. of spher. gr.	1.49 (w. bi.) [W]
Pumice (volcanic glass), Na, K, Al, silicate	. . .	vesicular vitr. frag.	c 1.50 (isot.) [M*]
Aluminum hydrate, $Al(OH)_3$	2.45	v. fine amorph. part.	$n_{\Sigma c}$ 1.50–1.56 [M*]
Gypsum, $CaSO_4 \cdot 2H_2O$	2.36	fine cryst. gr.	α1.520, γ1.530, β1.523 [LB]
Silica quartz), SiO_2	2.66	cryst. frag.	ϵ1.553, ω1.544 [LB]
(chalcedony), SiO_2	2.6	crypt. agg.	ϵ, ω1.54 [LB, M*]
China clay (kaolinite), $Al_2O_3 \cdot 2SiO_2 \cdot 2H_2O$	2.60	fine, vermicular cryst.	α1.558, γ1.565, β1.564 (all ± .005) [LB, M*]
Talc, $3MgO \cdot 4SiO_2 \cdot H_2O$	2.77	platy frag.	α1.539, γ1.589, β1.589 [LB]
Mica (muscovite), $H_2KAl_3(SiO_4)_3$	2.89	platy frag.	α1.563, γ1.604, β1.599 [LB]
Anhydrite, $CaSO_4$	2.93	cryst. frag.	α1.570, γ1.614, β1.575 [LB]
Chalk (whiting), $CaCO_3$	2.70	hollow spherulites	$\epsilon_{\Sigma c}$ 1.510, $\omega_{\Sigma c}$ 1.645 [M*]
Barytes (barite, nat.), $BaSO_4$	4.45	cryst. frag.	α1.636, γ1.648, β1.637 [LB]
(blanc fixe, art.), $BaSO_4$	4.36	v. fine cryst. agg.	1.62–1.64 [M*]
Barium carbonate, $BaCO_3$ (witherite)	4.3	. . .	α1.529, γ1.677, β1.676 [LB]

†Also called "Extender" or "Inert" White Pigments.

IRON OXIDE PIGMENTS

Ochre, yellow (goethite), $Fe_2O_3 \cdot H_2O$, clay, etc.	2.9–4.0	irr. spherulites	n_{Σ}2.0 (isot. part); $(\alpha, \beta)_{\Sigma}$ 2.05–2.31; γ_{Σ} 2.08–2.40 (bi. part) [M*]
Sienna, raw (goethite), $Fe_2O_3 \cdot H_2O$, clay, etc.	3.14	uneven spherulites	1.87–2.17 (mostly 2.06) (isot.) [M*]
Sienna, burnt, Fe_2O_3, clay, etc.	3.56	uneven, round. part.	c1.85 (var.) (isot.) [M]
Umber, raw, $Fe_2O_3 + MnO_2 + H_2O$, clay, etc.	3.20	uneven, round. gr.	mostly 1.87–2.17 [M*]
Umber, burnt, $Fe_2O_3 + MnO_2$, clay, etc.	3.64	uneven, round. gr.	mostly 2.2–2.3 [M*]
Iron oxide red (haematite), Fe_2O_3	5.2	min. cryst.	ϵ_{Li} 2.78, ω_{Li} 3.01 [M]

RED AND ORANGE PIGMENTS

Pigment Name and Chemical Composition[1]	Specific Gravity[2]	Particle Characteristics[3]	Refractive Index[4]
Red lead, Pb_3O_4 (c95%)	8.73	crypt. agg.	2.42_{Li} (w. bi.; pleo.) [M]
**Realgar, As_2S_2	3.56	cryst. frag.	α_{Li} 2.46, γ_{Li} 2.61, β_{Li} 2.59 [LB]
Molybdate orange, $Pb(Mo,S,Cr,P)O_4$	. . .	min. round. gr.	β_{Li} 2.55 (s. bi.) [M*]
Chrome orange, $PbCrO_4 \cdot Pb(OH)_2$	6.7	tabular cryst.	α2.42, γ2.7 +, β2.7 [M*]
Cadmium red lithopone, $CdS(Se) + BaSO_4$	4.30	min. round. gr.	2.50–2.76 (for CdS(Se)part) (isot.) [M*]
Cadmium red, CdS(Se)	4.5	min. round. gr.	2.64 (bright red)–2.77 (deep red) (isot.) [M*]
Antimony vermilion, Sb_2S_3	. . .	v. fine red glob.	n_{Li} 2.65 (isot.) [M*]
Vermilion (art.), HgS	8.09	hexagonal gr. and prisms	ϵ_{Li} 3.14, ω_{Li} 2.81 [M]
**(nat., cinnabar), HgS	8.1	cryst. frag.	ϵ_{Li} 3.146, ω_{Li} 2.819 [LB]
Quinacridone red, $C_{20}H_{12}O_2N_2$ (gamma)	1.5	thin plates	n_{Na} Av. 2.04 [Du P]

YELLOW PIGMENTS

**Gamboge, organic resin	. . .	irr. amorph. part.	1.582–1.586 [W]
**Indian yellow, $C_{19}H_{18}O_{11}Mg \cdot 5H_2O$	. . .	prisms, plates	1.67 (w. bi.) [M*]
Cobalt yellow, $CoK_3(NO_2)_6 \cdot H_2O$	. . .	fine dendritic cryst.	1.72–1.76 (isot.) [W]
Zinc yellow, $4ZnO \cdot 4CrO_3 \cdot K_2O \cdot 3H_2O$	3.46	min. spher. gr.	1.84–1.9 (irr.; bi.) [M*]
Strontium yellow, $SrCrO_4$	. . .	small needles	α, β (or ω) 1.92, γ (or ϵ) 2.01 ($\parallel$ext.) [M*]
Barium yellow, $BaCrO_4$	4.49	v. fine cryst. gr.	1.94–1.98 (bi.) [M]
**Naples yellow, $Pb_3(SbO_4)_2$	. . .	round. gr.	2.01–2.28 (isot.) [M*]
Chrome yellow (med.), $PbCrO_4$	5.96	fine prism. gr.	$\alpha_{620m\mu} < 2.31$, $\gamma_{650m\mu}$ 2.49 [M]
Cadmium yellow lithopone, $CdS + BaSO_4$	4.25	fine comp. gr.	2.39–2.40 (for CdS part) [M*]
Cadmium yellow, CdS	4.35	min. round. gr.	2.35–2.48 (isot.) [M*]
Massicot (litharge), PbO	9.40	min. flakes	α_{Li} 2.51, γ_{Li} 2.71, β_{Li} 2.61 [M]
**Orpiment, As_2S_3	3.4	min. flakes	α_{Li} 2.4 ±, γ_{Li} 3.02, β_{Li} 2.81 [LB]

GREEN PIGMENTS

Phthalocyanine green, chloro-copper phthalocyanine	2.1	laths	$n_{580m\mu}$ 1.40 [ACC]
**Verdigris (copper basic acetate), $Cu(C_2H_3O_2)_2 \cdot 2Cu(OH)_2$	. . .	cryst. frag.	α1.53, γ1.56 [M]
**Chrysocolla, $CuSiO_3 \cdot \eta H_2O$	2.4	crypt. agg.	α1.575, γ1.598, β1.597 [LB]
Green earth (celadonite and glauconite), Fe, Mg, Al, K, hydrosilicate	2.5–2.7	round. irr. gr.	n var. c 1.62, (porous) [M*]
Emerald green (Paris green), $Cu(C_2H_3O_2)_2 \cdot 3Cu(AsO_2)_2$	3.27	spherulites and disks	α_{Σ}1.71, γ_{Σ}1.78 (w. pleo.) [M*]
**Malachite, $CuCO_3 \cdot Cu(OH)_2$	4.0	cryst. frag.	α1.655, γ1.909, β1.875 [LB]
Cobalt green, $CoO \cdot \eta ZnO$	. . .	spher. gr.	1.94–2.0 (w. bi.) [M*]
Viridian (chromium oxide, transparent), $Cr_2O_3 \cdot 2H_2O$	3.32	spherul. gr.	α, β_{Σ} 1.82, γ_{Σ} 2.12 [M*]
Chrome green (med.), $Fe_4[Fe(CN)_6]_3 + PbCrO_4$	4.06	fine green agg.	c 2.4 (cf. Prussian blue and chrome yellow)
Chromium oxide green, opaque, Cr_2O_3	5.10	fine cryst. agg.	n_{Li} 2.5 [M]

BLUE PIGMENTS

Pigment Name and Chemical Composition[1]	Specific Gravity[2]	Particle Characteristics[3]	Refractive Index[4]
Phthalocyanine blue, copper phthalocyanine	1.6	laths	Av. 1.38 [DuP]
Ultramarine blue (art.), $Na_{8-10}Al_6Si_6O_{24}S_{2-4}$	2.34	uniform small round. gr.	n 1.51$_{\text{green}}$, 1.63$_{\text{red}}$ (isot.) [M]
**(nat., lazurite), $3Na_2O \cdot 3Al_2O_3 \cdot 6SiO_2 \cdot 2Na_2S$	2.4	angular, broken frag.	1.50± (isot.) [LB]
**Maya blue, Fe, Mg, Ca, Al, silicate (?)	. . .	porous irr. agg.	β_Σ1.54 (irr.; bi. and pleo.) [M*]
Smalt, K, Co(Al), silicate (glass)	. . .	splintery, vitr. frag.	1.49–1.52 [M*]
Prussian blue, $Fe_4[Fe(CN)_6]_3$	1.83	colloidal agg.	1.56$_{460m\mu}$ [M*]
**Egyptian blue, $CaO \cdot CuO \cdot 4SiO_2$	. . .	cryst. frag.	ϵ1.605, ω1.635 [APL]
Manganese blue, $BaMnO_4 + BaSO_4$	. . .	gr. and stubby prisms	c 1.65 [W]
**Blue verditer, $2CuCO_3 \cdot Cu(OH)_2$	. . .	fibrous agg.	α_Σ1.72, $\gamma_\Sigma$slightly > 1.74 [M*]
Cobalt blue, $CoO \cdot Al_2O_3$	3.83	round. gr.	n var.; max. c 1.74$_{\text{blue}}$ (isot.) [M]
**Azurite, $2CuCO_3 \cdot Cu(OH)_2$	3.80	cryst. frag.	α1.730, γ1.838, β1.758 [LB]
Cerulean blue, $CoO \cdot \eta SnO_2$	. . .	round gr.	1.84 (isot.) [M*]

VIOLET PIGMENTS

Ultramarine violet	. . .	round. gr. (blue, rose and violet)	c 1.56 (isot.) [M*]
Cobalt violet, $Co_3(PO_4)_2$	. . .	round. gr.	ϵ1.65–1.79 (dull violet), ω1.68–1.81 (salmon) (s. bi.) [M*]
Manganese violet, $(NH_4)_2Mn_2(P_2O_7)_2$	. . .	fine cryst. gr.	α1.67, γ1.75, β1.72 (for violet) [M]
Quinacridone violet, $C_{20}H_{12}O_2N_2$ (beta)	1.5	thin plates	Av. 2.02 [DuP]

BROWN PIGMENTS

Sepia (organic)	. . .	angular frag.	(opaque) [M*]
Asphaltum (bitumen)	. . .	irr. amorph. part.	1.64–1.66 [M*]
Van Dyke brown (bituminous earth)	1.66	irr. amorph. part.	1.62–1.69 [M*]

BLACK PIGMENTS

Bone black, $C + Ca_3(PO_4)_2$	2.29	irr. coarse grains	1.65–1.70 (for larger translucent gr.) [M]
Lamp black, C	1.77	min. round. part.	(opaque)
Charcoal black, C	. . .	irr. splintery part.	(opaque)
Graphite, C	2.36	irr. plates	(opaque) [M]

[1] Abbreviations: art. = artificial; med. = medium; nat. = natural. The chemical formulas are those commonly accepted in chemical and mineralogical literature, but they may not compare exactly with structural formulas based on x-ray diffraction data or even on critical chemical analysis.

[2] The figures for specific gravity of the artificial pigments are mainly from H. A. Gardner, pp. 710–712, and those on the mineral pigments are chiefly from E. S. Larsen and H. Berman.

[3] Symmetry terms (monoclinic, orthorhombic, etc.) are omitted because pigments are so finely divided that it is rare when observations on crystal symmetry can be made. The term "spherulitic," as used here means aggregates that tend toward radial structure and spherical shape. "Amorphous" describes materials that are microscopically formless but may be truly crystalline on the basis of x-ray diffraction data. Abbreviations: agg. = aggregate(s); amorph. = amorphous; comp. = composite; crypt. = cryptocrystalline; cryst. = crystal(s); frag. = fragment(s); glob. = globule(s); gr. = grain(s); irr. = irregular; min. = minute; part. = particle(s); prism. = prismatic; round. = rounded; spher. = spheroidal; spherul. = spherulitic; var. = variable; v. = very; vitr. = vitreous.

[4] Unless otherwise indicated, all refractive index measurements are by sodium light. Σ is the symbol used by H. E. Merwin to indicate greater or less indefiniteness or irregularity in the case of aggregates, especially in respect to refractive index. Abbreviations: bi. = birefringent; c = *circa*; ext. = extinction; isot. = isotropic; ‖ = parallel; pleo. = pleochroic; s. = strongly; w. = weakly. The letters in brackets refer to the authorities for the refractive index data: M = H. E. Merwin; M* = H. E. Merwin, data by private communication, hitherto unpublished; W = C. D. West data by private communication, hitherto unpublished; LB = E. S. Larsen and H. Berman; APL = A. P. Laurie and co-authors; ACC = A. C. Cooper, "The refractive index of organic pigments. Its determination and significance," *Journal Oil & Colour Chemists Association*, Vol. 31 (1948), pp. 343–357; TPC = Titanium Pigment Corporation; Du P = E. I. Du Pont de Nemours & Co.

**Chiefly of historical interest.

CRITICAL TEMPERATURES AND PRESSURES

Compiled by Rudolf Loebel

Table I —Organic compounds
Table II—Inorganic compounds

Table I

Formula	Name	Critical temp. T_c °C	Critical press. P_c atm.
$CHClF_2$	Methane, monochlorodifluoro-	96	48.5
$CHCl_2F$	Methane, dichloromonofluoro-	178.5	51
$CHCl_3$	Methane, trichloro- (Chloroform)	263	54
CHF_3	Methane, trifluoro- (Fluoroform)	25.9	46.9
CH_2Cl_2	Methylene chloride	237	60
CH_3NO_2	Methane, nitro-	314.8	62.3
CH_3Br	Methane, monobromide-	194	83.4
CH_3Cl	Methane, monochloro-	143.8	65.9
CH_3F	Methane, monofluoro-	44.6	58
CH_3I	Methane, monoiodo-	254.8	72.7
CH_4	Methane	−82.1	45.8
CH_4O	Methanol (Methyl alcohol)	240	78.5
CH_4S	Methylmercaptan	196.8	71.4
CH_5N	Methylamine	156.9	40.2
$CBrF_3$	Methane, monobromotrifluoro-	67	50.3
$CClF_3$	Methane, monochlorotrifluoro-	28.85	38.2
CCl_2F_2	Methane, dichlorodifluoro-	111.5	39.6
CCl_3F	Methane, trichloromonofluoro-	198	43.2
CCl_4	Methane, tetrachloro- (Carbon tetrachloride)	283.1	45
CF_4	Methane, tetrafluoro-	−45.7	41.4
C_2H_2	Acetylene	35.5	61.6
C_2H_2	Ethyne (see Acetylene)	35.5	61.6
$C_2H_2F_2$	Ethylene, 1,1-difluoro-	30.1	—
C_2H_3N	Acetonitrile	274.7	47.7
$C_2H_3F_3$	Ethane, 1,1,1-trifluoro-	73.1	—
C_2H_4	Ethene	9.9	50.5
C_2H_4	Ethylene (see Ethene)	9.9	50.5
C_2H_4O	Acetaldehyde	187.8	54.7
C_2H_4O	Ethylene oxide	195.8	71
$C_2H_4O_2$	Acetic acid	321.6	57.1
$C_2H_4O_2$	Formic acid, methyl- (Methyl formate)	214	59.2
$C_2H_4Cl_2$	Ethane, 1,1-dichloro-	249.8	50
$C_2H_4F_2$	Ethane, 1,1-difluoro-	386.7	—
C_2H_5Br	Ethane, monobromo-	230.8	61.5
C_2H_5Cl	Ethane, monochloro-	187.2	52
C_2H_5F	Ethane, monofluoro-	102.16	49.6
C_2H_6	Ethane	32.2	48.2
C_2H_6O	Ether, dimethyl-	127	52.6

DEFINITIONS

AB — A prefix attached to the names of the practical electric units to indicate the corresponding unit in the cgs electromagnetic system (emu), e.g. abampere, abvolt.

Abcoulomb — The abcoulomb, the emu of charge, is defined as the charge which passes a given surface in 1 sec if a steady current of one abampere flows across the surface. Its dimensions are, therefore, $cm^{1/2}\ g^{1/2}$, which differ from the dimensions of the statcoulomb by a factor which has the dimensions of a speed. This relationship is connected with the fact that the ratio $2K_e/K_m$ must have the value of the square of the speed of light in any consistent system of units. It follows further that

$$1 \text{ abcoulomb} = 2.99793 \times 10^{10} \text{ statcoulomb},$$

the speed of light in vacuo being $(2.99793 \pm 0.000003) \times 10^{10}$ cm/sec.

Aberration — 1. In astronomy, the apparent angular displacement of the position of a celestial body in the direction of motion of the observer, caused by the combination of the velocity of the observer and the velocity of light. See constant of aberration, planetary aberration. Compare parallax. 2. In optics, a specific deviation from perfect imagery, as, for example: spherical aberration, coma, astigmatism, curvature of field, and distortion.

Aberrations (of image) — Distortions in shape, color, focus, and density of images caused by imperfect optical elements (i.e., lens, prism, mirror, screen, etc.) Types such as coma, astigmatism, field curvature, distortion, and chromatic and spherical aberrations.

Absolute humidity — See Humidity.

Absolute pressure — See Pressure.

Absolute temperature — Temperature reckoned from the absolute zero. See Temperature.

Absolute units — A system of units based on the smallest possible number of independent units. Specifically, units of force, work, energy, and power not derived from or dependent on gravitation.

Absolute zero — The theoretical temperature at which molecular motion vanishes and a body would have no heat energy; the zero point of the Kelvin and Rankine temperature scales.

Absolute zero may be interpreted as the temperature at which the volume of a perfect gas vanishes or, more generally, as the temperature of the cold source which would render a Carnot cycle 100% efficient. The value of absoute zero is now estimated to be −273.15°C, −459.67°F, 0 K, and 0° Rankine.

Absorption — 1. Penetration of a substance into the body of another. 2. Transformation into other forms suffered by radiant energy passing through a material substances.

Absorption coefficient (α) — 1. A measure of the amount of normally incident radiant energy absorbed through a unit distance or by a unit mass of absorbing medium. Compare transmission coefficient.

The absorption coefficiet is frequently identified as follows:

$$I_{\lambda x} = I_{\lambda o}\ e^{-k^{\lambda}x}$$

where $I_{\lambda x}$ is the flux density of radiation of wavelength λ, initially of flux density $I_{\lambda o}$, after traversing a distance x in some absorbing medium.

2. In acoustics, the ratio of the sound energy absorbed by a surface of a medium (or material) exposed to a sound field or sound radiation to the sound energy incident on the surface. The stated values of this ratio are to hold for an infinite area of the surface. The conditions under which measurements of absorption coefficients are made are to be stated explicitly.

Three types of absorption coefficients associated with three methods of measurement are: chamber absorption coefficient, obtained in a certain reverberation chamber; free-wave absorption coefficient, obtained when a plane, progressive, sound wave is incident on the surface of the medium; sabine absorption coefficient, obtained when the sound is incident from all directions on the sample. See Absorption Factor.

Absorption cross sections — In radar, the ratio of the amount of power removed from a beam by absorption of radio energy by a target to the power in the beam incident upon the target. Compare scattering cross section. See Cross section.

Absorption factor — The ratio of the intensity loss by absorpotion to the total original intensity of radiation. If I_o represents the original intensity, I_r, the intensity of reflected radiation, I_t, the intensity of the transmitted radiation, the absorption factor is given by the expression

$$\frac{I_o - (I_r + I_t)}{I_o}$$

Also called coefficient of absorption.

Absorption, Lambert's law — If I_o is the original intensity, I the intensity after passing through a thickness x of a material whose absorption coefficient is k,

$$I = I_o e^{-kx}$$

The index of absorption k′ is given by the relation $k = (4\pi k'n)/\lambda$ where n is the index of refraction and λ the wave length in vacuo. The mass absorption is given by k/d when d is the density. The transmission factor is given by I/I_o.

Absorption spectrum — The array of absorption lines and absorption bands which results from the passage of radiant energy from a continuous source through a selectively absorbing medium cooler than the source. See electromagnetic spectrum.

The absorption spectrum is a characteristic of the absorbing medium, just as an emission spectrum is a characteristic of a radiator.

An absorption spectrum formed by a monatomic gas exhibits discrete dark lines, whereas that formed by a polyatomic gas exhibits ordered arrays (bands) of dark lines, which appear to overlap. This type of absorption is often referred to as line absorption. The spectrum formed by a selectively absorbing liquid or solid is typically continuous in nature (continuous absorption).

The spectrum obtained by the examination of light from a source, itself giving a continuous spectrum after this light has passed through an abosrbing medium in the gaseous state. The absorption spectrum will consist of dark lines or bands, being the reverse of the emission spectrum of the absorbing substance.

When the absorbing medium is in the solid or liquid state the spectrum of the transmitted light shows broad dark regions which are not resolvable into lines and have no sharp or distinct edges.

Absorptive index — The imaginary part of the complex index of refraction of a medium. It represents the energy loss by absorption and has a nonzero value for all media which are not dielectrics. Also called index of absorption. Compare absorption coefficient.

Absorptive power or absorptivity for any body is measured by the fraction of the radiant energy falling upon the body which is absorbed or transformed into heat. This ratio varies with the character of the surface and the wave length of the incident energy. It is the ratio of the radiation absorbed by any substance to that absorbed under the same conditions by a black body.

Abvolt — The cgs electromagnetic unit of potential difference and electromotive force. It is the potential difference that must exist between two points in order that one erg of work be done when one abcoulomb of charge is moved from one point to the other. One abvolt is 10^{-8} V.

Acceleration — The time rate of change of velocity in either speed or direction. Cgs unit, 1 cm/sec/sec. Dimensions, — $[l\,t^{-2}]$ — See Angular acceleration.

Acceleration due to gravity — The acceleration of a body freely falling in a vacuum. The International Committee on Weights and Measures has adopted as a standard or accepted value, 980.665 cm/sec^2 or 32.174 ft/sec^2.

Acceleration due to gravity at any latitude and elevation — If ϕ is the latitude and H the elevation in centimeters the acceleration in cgs units is, $g = 980.616 - 2.5928 \cos 2\phi + 0.0069 \cos^2 2\phi - 3.086 \times 10^{-6} H$. (Helmert's equation)

Accelerators — Machines for speeding up subatomic particles to energies running into millions of electron volts. See Betatron, Cyclotron, etc.

Acceptor — In transistors, the P-type semiconductor, the electrode containing trivalent impurities (boron, gallium, or indium) to increase the number of holes which can accept electrons. Contrast with donor.

Achromatic — A term applied to lenses signifying their more or less complete correction for chromatic aberration.

Acid — For many purposes it is sufficient to say that an acid is a hydrogen-containing substance which dissociates on solution in water to produce one or more hydrogen ions. More generally, however, acids are defined according to other concepts. The Bronsted concept states that an acid is any compound which can furnish a proton. Thus NH_4^+ is an acid since it can give up a proton:

$$NH_4^+ \rightleftharpoons NH_3 + H^+$$

and NH_3 is a base since it accepts a proton.

A still more general concept is that of G. N. Lewis which defines an acid as anything which can attach itself to something with an unshared pair of electrons. Thus in the reaction

$$H^+ + :NH_3 \rightleftharpoons NH_4^+$$

the NH_3 is a base because it possesses an unshared pair of electrons. This latter concept explains many phenomena, such as the effect of certain substances other than hydrogen ions in the changing of the color of indicators. It also explains acids and bases in nonaqueous systems as liquid NH_3 and SO_2.

Acoustic velocity (symbol a) = speed of sound.

Actinic — Pertaining to electromagneic radiation capable of initiating photochemical reactions, as in photography or the fading of pigments.

Because of the particularly strong action of ultra violet radiation on photochemical processes, the term has come to be almost synonymous with ultraviolet, as in actinic rays.

Actinide Series — Elements of atomic numbers 89 to103 analogous to the lanthanide series of the so-called rare earths.

Actinometer — The general name for any instrument used to measure the intensity of radiant energy, particularly that of the sun. See Actinometry. See also Bolometer, Dosimeter, Photometer, Radiometer.

Actinometers may be classified, according to the quantities which they measure, in the following manner: (a) pyrheliometer, which measures the intensity of direct solar radiation; (b) pyranometer, which measures global radiation (the combined intensity of direct solar radiation and diffuse sky radiation); and (c) pyrgeometer, which measures the effective terrestrial radiation.

Action is measured by the product of work by time. Cgs units of action are the erg-second and the joule-second. Dimensions, — $[m\ l_2\ t^{-1}]$. Planck's quantum or constant of action is $(6.62517 - 0.00023) \times 10^{-27}$ erg-sec.

Active mass of a substance is the number of gram molecular weights per liter in solution, or in gaseous form.

Activity coefficient — A factor which, when multiplied by the molecular concentration yields the active mass. The activity coefficient is evaluated by thermodynamic calculations, usually from data on the emf of certain cells, or the lowering of the freezing point of certain solutions. It is a correction factor which makes the thermodynamic calculations correct.

Adiabatic — A body is said to undergo an adiabatic change when its condition is altered without gain or loss of heat. The line on the pressure volume diagram representing the above change is called an adiabatic line.

Adiabatic atmosphere — A model atmosphere in which the pressure decreases with height according to:

$$p = p_o\ [1 - (-\ gz/c_{p,d}T_o)]\ c_{p,d}R_d$$

where p_o and T_o are the pressure and temperature (°K) at sea level or other datum; z is the geometric height; R_d is the gas constant for dry gas; $c_{p,d}$ is the specific heat for dry gas at constant pressure; and g is the acceleration of gra vity. Also called dry-adiabatic atmosphre, convective atmosphere, homogeneous atmosphere. See Homogeneous atmosphere, Barotropy.

Adiabatic process — A thermodynamic change of state of a system in which there is no transfer of heat or mass across the boundaries of the system. In an adiabatic process, compression always results in warming, expansion in cooling. See Diabatic process.

Adsorption — The condensation of gases, liquids, or dissolved substances on the surfaces of solids is called adsorption.

Air columns, frequency of vibration in — See Organ pipes.

Albedo — The ratio of the amoung of electromagnetic radiation reflected by a body to the amount incident upon it, often expressed as a percentage, as, the albedo of the earth is 34%.

The concept defined above is identical with reflectance. However, albedo is more commonly used in astronomy and meteorology and reflectance in physics.

Albedo is sometimes used to mean the flux of the reflected radiation as, the earth albedo is 0.64 cal/cm². This usage should be discouraged.

The albedo is to be distinguished from the spectral reflectance, which refers to one specific wavelength (monochromatic radiation).

Usage varies somewhat with regard to the esact wavelength interval implied in albedo figures; sometimes just the visible portion of the spectrum is considered, sometimes the totality of wavelengths in the solar spectrum.

Alfvén speed — The speed at which Alfvén waves are propagated along the magnetic field.

For a perfectly conducting fluid with a mass density of 1 kg/m³ in a magnetic field of 10,000 gauss, the Alfvén speed is about 1000 m/sec while the speed of sound in air is about 300 m/sec.

Alfvén wave — A transverse wave in a magneto-hydrodynamic field in which the driving force is the tension introduced by he magnetic field along the lines of force. Also called magneto-hydrodynamic wave.

The dynamics of such waves are analogous to those in a vibrating string, the phase speed C being given by

$$C^2 = \mu H^2/4\pi\rho$$

where μ is the permeability; H is the magnitude of the magnetic field; and ϱ is the fluid density. Dissipative effects due to fluid viscosity and electrical resistance may also be present.

Allobar — A form of an element differing in isotopic composition from the naturally occurring form.

Allotropy — The property shown by certain elements or being capable of existence in more than one form, due to differences in the arrangement of atoms or molecules. See Monotropic and Enantiotropic.

Alpha (α)-particle, or alpha-ray — One of the particles emitted in radioactive decay. It is identical with the nucleus of the helium atom and consists, therefore, of two protons plus two neutrons bound together. A moving alpha particle is strongly ionizing and so loses energy rapidly in traversing through matter. Natural alpha particles will traverse only a few centimeters of air before coming to rest.

Alternating current, (A-C) — Current in which the charge-flow periodically reverses, as opposed to direct current, and whose average value is zero. Alternating current usually implies a sinusoidal variation of current and voltage. This behavior is represented mathematically in various ways:

$$I = I_o \cos (2\pi ft + \phi)$$
$$I = I_o < \phi$$
$$I = I_1{}^{j\omega t}$$

where fi is the frequency; $\omega \equiv 2\pi f$, the pulsatance, or radian frequency; ϕ the phase angle; I_o the amplitude; and I_1 the complex amplitude. In the complex rotation, it is understood that the actual current is the real part of I. For circuits involving also a capacitance C in farads and L in henrys, the impedance becomes,

$$\sqrt{R^3 + \left(2\pi fL - \frac{1}{2\pi fC}\right)^2}$$

Altitudes with the barometer — If b_1 and b_2 denote the corrected barometer readings at two stations, t the mean of the temperatures, t_1 and t_2 of the air at the two staions, e_1 and e_2 the tension of water vapor at the two staions, h the mean height above sea level, ϕ the latitude; then the difference in elevation in centimeters is $H = 1{,}843{,}000\ (\log b_1 - \log b_2)\ (1 + 0.00367t)\ (1 + 0.0026 \cos 2\phi + 0.00002h + 3/8k)$, where

$$k = \tfrac{1}{2}\left(\frac{e_1}{b_1} + \frac{e_2}{b_2}\right)$$

An approximate formula, sufficient for differences not over 1000 m is

$$H = 1{,}600{,}000\ \frac{b_1 - b_2}{b_1 + b_2}\ (1 + 0.004t).$$

Amorphous — Without definite form, not crystallized.

Ampere (unit of electric current) is the constant current which, if maintained in two straight parallel conductors of infinite length, of negligible circular sections, and placed 1 m apart in a vacuum, will produce between these conductors a force equal to 2×10^{-2} newton per meter of length.

Ampère's law — A vector equation relating current flow and magnetic fields. The law states that if a current (I) flows through an infinitesimal distance (dl) along a line, at some point (P) a distance (r) away there is produced an infinitesimal element of a magnetic field (dH) such that

$$|dH| = I \sin \theta \, d l / |r^2|.$$

where θ is the angle between the direction of current flow and the line joing P and dl. More compactly,

$$d H = I \, d l \times r/r^3$$

Ampere's rule — A positive charge moving horizontally is deflected by a force to the right if it is moving in a region where the magnetic field is vertically upward. This may be generalized to currents in wires by recallig that a current in a certain direction is equivalent to the motion of positive charges in that direction. The force felt by a negative charge is opposite to that felt by a positive charge.

Ampere-turn — A measure of magnetomotive force, especially as developed by an electric current, defined as the magnetomotive force developed by a coil of one turn through which a current of one ampere flows, that is, 1.26 Gb.

Amplitude — The maximum value of the displacement in an oscillatory motion.

Amplitude modulation — The variation of the amplitude of a wave in a way that corresponds to another wave. In general, the positive or negative envelope of the modulated wave (carrier wave) contains enough information to allow the modulating wave to be recovered, provided that the carrier wave has at least twice the frequency and twice the peak amplitude of the modulating signal. The modulated carrier C(t) is given by

$$C(t) = A_0 \; [1 - k \, M(t)] \; \cos \omega_0 t,$$

Where M(t) is the modulation.

Amplitude (of wave) — A measure of the maximum displacement of the wave crest from its undisturbed position (or the maximum electric or magnetic field strength of an electromagnetic wave).

AMU — The atomic mass unit (AMU), a unit of mass equal to 1/12 the mass of the carbon atom of mass number 12. On the atomic mass scale $^{12}C \equiv 12$.

$$\begin{aligned} 1 \text{ AMU} &= 931.4812(52) \text{ MeV} \\ &= 1.6605655(86) \times 10^{-27} \text{ (SI units)} \\ &= 1.6605655(86) \times 10^{-24} \text{ (cgs units)} \end{aligned}$$

The numbers in parentheses are the standard deviation uncertainties in the last digits of the quoted value, computed on the basis of internal consistency.

Angle — The ratio between the arc and the radius of the arc. Units of angle, the radian, the angle subtended by an arc equal to the radius; the degree, 1/360 part of the total angle about a point. Dimensions, a numeric.

Angstrom — A unit of length, used especially in expressing the length of light waves, equal to one ten-thousandth of a micron, or one hundred-millionth of a centimerer (1×10^{-8} cm).

Angular acceleration — The time rate of change of angular velocity either in angular speed or in direction of the axis of rotation (precession). Cgs unit, 1 radian/sec/sec. Dimensions $[t^{-2}]$.

If the initial angular velocity is ω_o, and the velocity after time t is ω_t, the angular acceleration,

$$\alpha = \frac{\omega_t - \omega_o}{t}$$

The angular velocity after time t,

$$\omega_t = \omega_o + \alpha t$$

The angle swept out in time t,

$$\theta = \omega_o t + \tfrac{1}{2}\alpha t^2$$

The angular velocity after movement through the arc θ,

$$\omega = \sqrt{\omega_o{}^2 + 2\alpha\theta}$$

In the above equations, for angular displacement in radians, angular velocity will be in radians per second and angular acceleration in radians per second per second.

Angular aperture of an objective is the largest angular extent of wave surface which it can transmit.

Angular harmonic motion or harmonic motion of rotation — Periodic, oscillatory angular motion in which the restoring torque is proportional to the angular displacement. Torsional vibration.

Angular momentum or moment of momentum — Quantity of angular motion measured by the product of the angular velocity and the moment of inertia. Cgs unit, unnamed, its nature is expressed by g-cm²/sec. Dimentions, $[ml^2 t^{-1}]$.

The angular momentum of a mass whose moment of inertia is I, rotating with angular velocity w, is Iw.

Angular velocity — Time rate of angular motion about an axis. Cgs unit, radian/sec. Dimensions, $[t^{-1}]$.

If the angle described in time *t* is θ, the angular velocity,

$$\omega = \frac{\theta}{t}$$

θ in radians and *t* in seconds gives ω in radians per second.

Anhydride (of acid or base) — An oxide which when combined with water gives an acid or base.

Anion — A negatively charged ion.

Anisotropic — Exhibiting different properties when tested along aes in different directions.

Anode — The electrode at which oxidation occurs in a cell. It is also the electrode toward which anions travel due to the electrical potential. In spontaneous cells the anode is considered negative. In nonspontaneous or electrolytic cells the anode is considered positive.

Antiferromagnetic materials — Those in which the magnetic moments of atoms or ions tend to assume an ordered arrangement in zero applied field, such that the vector sum of the moments is zero, below a characteristic temperature called the Neel Point. The permeability of antiferromagnetic materials is comparable to that of paramagnetic materials. Above the Neel Point, these materials become paramagnetic.

Anti-matter — Matter consisting of antiparticles.

Anti-particle — Any particle with a charge of opposite sign to the same particle in normal matters.

Thus, the proton has a positive charge; the anti-proton, a negative charge. When a particle and its anti-particle collide, both may disappear with the creation of lighter particles; this process is called annihilation.

Aperture ratio — The ratio of the useful diameter of a lens to its focal length. It is the reciprocal of the f-number.

In application to an optical instrument, rather than to a lens, numerical aperture is more commonly used. The aperture ratio is then twice the tangent of the angle whose sine is the numerical aperture.

Apochromat — A term applied to photographic and microscope objectives indicating the highest degree of color correction.

Archimedes principle — A body wholly or partly immersed in a fluid is buoyed up by a force equal to the weight of the fluid displaced. A body of volume V cm³ immersed in a fluid of density ϱ grams per cm³ is buoyed up by a force in dynes,

$$F = \rho g V$$

where g is the accleration due to gravity.

A floating body displaces its own weight of liquid.

Area, unit of — The square centimeter. The area of a square whose sides are one centimeter in length. Other units of area are similarly derived. Dimensions, $[L^2]$.

Arrhenius theory of electrolytic dissociation states that the molecule of an electrolyte can give rise to two or more electrically charged atoms or ions.

Astigmatism is an error of spherical lenses peculiar to the formation of images by oblique pencils. The image of a point when astigmatism is present will consist of two focal lines at right angles to each other and separated by a measurable distance along the axis of the pencil. The error is not eliminated by reduction of aperture as is spherical aberration.

Astronomical unit (abbr. AU) — 1. A unit of length, usually defined as the distance from the earth to the sun, 149,599,000 km. This value for the AU was derived from radar observations of the distance of Venus. The value given in astronomical ephemerides, 149,599,000 km, was derived from observations of the minor planet Eros.

2. The unit of distance in terms of which, in the Kepler Third Law, $n^2a^3 = k^2(1 + m)$, the semimajor axis a of an elliptical orbit must be expressed in order that the numerical value of the Gaussian constant k may be exactly 0.01720209895 when the unit of time is the ephemeris day.

In astronomical units, the mean distance of the earth from the sun, calculated by the Kepler law from the observed mean motion n and adopted mass m, is 1.00000003.

Atmosphere, standard — 1 standard atmosphere = 1,013,250 dyn/cm² i.e., 101,325 N/m².

Atmospheric radiation — Infrared radiation emitted by or being propagated through the atmosphere. See Insolation.

Atmospheric radiation, lying almost entirely within the wavelength interval of from 3 to 80 μm, provides one of the most important mechanisms by which the heat balance of the earth-atmosphere system is maintained. Infrared radiation emitted by the earth's surface (terrestrial radiation) is partially absorbed by the water vapor of the atmosphere which in turn reemits it, partly upward, partly downward. This secondarily emitted radiation is then, in general, repeatedly absorbed and reemitted, as the radiant energy progresses through the atmosphere. The downward flux, or counterradiation, is of basic importance in the greenhouse effect; the upward flux is essential to the radiative balance of the planet.

Atom — The smallest particle of an element which can enter into a chemical combination. All chemical compounds are formed of atoms, the difference between compounds being attributable to the nature, number, and arrangement of their constituent atoms. See Isotopes, Nuclear atom.

Atomic bomb — An explosive that derives its energy from the fission or fusion of atomic nuclei.

Atomic energy — 1. The constitutive internal energy of the atom which was absorbed when it was formed. 2. Energy derived from the mass converted into energy in nuclear transformations. See Einstein's formula.

Atomic mass (atomic weight) — The mass of a neutral atom of a nuclide. It is usually expressed in terms of the physical scale of atomic masses, that is, in atomic mass units (AMU). See AMU.

Atomic mass unit (AMU) — A measure of atomic mass, defined as equal to 1/12 the mass of a carbon atom of mass 12.

Atomic number (symbol Z) — An interger that expres ses the positive charge of the nucleus in multiples of the electronic charge e. It is the number of electrons outside the nucleus of a neutral (un-ionized) atom and, according to widely accepted theory, the number of protons in the nucleus.

An element of atomic number Z occupies the Zth place in the periodic table of the elements. Its atom has a nucleus with a charge +Ze, which is normally surrounded by Z electrons, each of charge −e.

For example, the carbon isotope $_6C^{14}$ has an atomic number of 6 and an atomic mass of 14.

Atomic structure — According to the currently accepted view, the atom consists of a central part, called nucleus, and a number of electrons (called orbital or planetary electrons) circling about the latter, like planets about the sun. The nucleus is of a high specific weight; it contains most of the mass of the entire atom (its mass is considered equal to the atomic mass) and is composed of positively charged particles, called protons (the number of which always equals the atomic number, (Z), and particles of 0 charge, called neutrons (the number of which equals the difference between the atomic weight and the atomic number, A − Z). The diameter of the nucleus is between 10^{-13} and 10^{-12} cm, and the relatively vast distance in which the orbital electrons circle about it is illustrated by the fact that this nuclear diameter is only 10^{-4} to 10^{-5} of the entire atomic diameter. While the nucleus carries an integral number of positive charges (an integral number of protons) each of 1.6×10^{-19} coulomb, each electron carries one negative charge of 1.6×10^{-19} coulomb, and the number of orbital electrons is equal to the number of protons in the nucleus (i.e. to the atomic number, Z), so that the atom as a whole has a net charge of 0. The electrons are arranged in successive shells (q.v.) around the nucleus; the maximum number of electrons in each shell is determined by natural laws, and the extranuclear electronic structure of the atom is characteristic of the element. The electrons in the inner shells are tightly bound to the nucleus; this inner structure can be altered by high-energy particles, γ-rays of radium, of X-rays. The electrons in the outer shells are responsible for the chemical properties of the element. See Bohr's atomic theory, Heisenberg's theory, Shell, and Subshell.

Atomic theory — All elementary forms of matter are composed of very small unit quantities called atoms. The atoms of a given element all have the same size and weight. The atoms of different elements have different sizes and weights. Atoms of the same or different elements unite with each other to form very small unit quantities of compound substances called molecules.

Atomic weight — Atomic weight is the relative weight of the atom on the basis of $^{12}C \equiv 12$. For a pure isotope, the atomic weight rounded off to the nearest integer gives the total number of nucleons (neutrons and protons) making up the atomic nucleus. If these weights are expressed in grams they are called gram atomic weights. See Isotopes and Atomic mass.

Atomic weight (abbr at. wt.) — The weight of an atom according to a scale of atomic weight units, awu, valued as one-twelfth the mass of the carbon atom ($C^{12} = 12.00000$).

Thus expressed, the atomic weight to the nearest integer is identical with the mass number.

Attenuation coefficient (symbol α) — A measure of the space rate of attenuation of any transmitted electromagnetic radiation. The attenuation coefficient is defined by

$$dI = -\alpha I_0 dx$$

or

$$I = I_0 e^{-\alpha x}$$

where I is the flux density at the selected point in space; I_o is the flux density at the source; and α is the attenuation coefficient.

ATTO — A prefix meaning one quintillionth or 10^{-18}. Symbol is a.

Avogadro's law — Equal volumes of different gases at the same pressure and temperature contain the same number of molecules.

Avogadro's number — The number of molecules in one mole or gram-molecular weight of a substance. A number of values of the Avogadro number, which is usually denoted by N, have been found by various methods, generally lying withing a range of 1% about the value 6.022045×10^{23}/gm.

Avogadro's principle (or theory) — The numbers of molecules present in equal volumes of gases at the same temperature and pressure are equal.

Azimuth — 1. Horizontal direction or bearing. Compare azimuth angle. 2. In navigation, the horizontal direction of a celestial point from a terrestrial point, expressed as the angular distance from a reference direction, usually measured from 0° at the reference direction clockwise through 360°.

An azimuth is often designated as true, magnetic, compass, grid, or relative as the reference direction is true, magnetic, compass, grid north, or heading, respectively. Unless otherwise specified, the term is generally understood to apply to true azimuth, which may be further defined as the arc of the horizon, or the angle at the zenith, between the north part of the celestial meridian or principal vertical circle and a vertical circle, measured from 0° at the north part of the principal vertical circle clockwise through 360°.

3. In astronomy, the direction of a celestial point from a terrestrial point measured clockwise from the north or the south point of the meridian plane. 4. In

surveying, the horizontal direction of an object measured clockwise from the south point of the meridian plane.

In surveying, an aximuth of a celestial body is called an astronomic azimuth.

Azimuth angle — 1. Azimuth measured from 0° at the north or south reference direction clockwise or counterclockwise through 90° or 130°.

Azimuth angle is labeled with the reference direction as a prefix and the direction of measurement from the reference direction as a suffix. Thus, azimuth angle S 144° W is 144° west of south, or azimuth 324°. When azimuth angle is measured through 180°, it is labeled N or S to agree with the latitude and E or W to agree with the meridian angle.

2. In surveying, an angle in triangulation or in traverse through which the computation of azimuth is carried.

Babo's law — The addition of a nonvolatile solid to a liquid in which it is soluble lowers the vapor pressure of the solvent in proportion to the amount of substance dissolved.

Balmer series of spectral lines. The wave lengths of a series of lines in the spectrum of hydrogen were given in angstroms by the equation

$$\lambda = 3646 \frac{N^2}{N^2 - 4}$$

where N is an integer having values greater than 2.

Bar — International unit of pressure 10^6 dyn/cm^2. Unfortunately some writers have used this term for 1 dyn/cm^2. 1 bar = 0.987 atm = 1000 mbars = 29.53 in of mercury. See Torr.

Barn — Unit for measuring capture cross sections (q.v.) of elements. One barn = 10^{-24} cm^2/nucleus.

Barotropy — The state of a fluid in which surfaces of constant density (or temperature) are coincident with surfaces of constant pressure; it is the state of zero baroclinity. Mathematically, the equation of batortopy states that the gradients of the density and pressure fields are proportional:

$$\Delta\rho = B\Delta p$$

where ϱ is the density; p is the pressure; and B is a function of thermodynamic variables, called the coefficient of barotropy.

With the equation of state, this relation determines the spatial distribution of all state parameters once these are specified on any surface. For a homogeneous atmosphere, B = 0; for an adiabatic atmosphere,

$$B = c_v/c_p \, RT$$

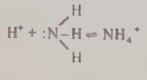
where c_v and c_p are the specific heats at constant volume and pressure, respectively; R is the gas constant; and T is the Kelvin temperature; for an isothermal atmosphere, B = 1/RT.

Barye — The pressure unit of the centimeter-gram-second system of physical units; equal to one dyne per square centimeter (0.001 mbar). Unfortunately some writers have used this term for the bar which is equal to 10^6 dyn/cm^2.

Bases — For many purposes it is sufficient to say that a base is a substance which dissociates on solution in water to produce one or more hydroxyl ions. More generally, however, bases are defined according to other concepts. The Bronsted concept states that a base is any compound which can accept a proton. Thus NH_3 is a base since it can accept a proton to form ammonium ions.

$$NH_3 + H^+ \rightleftharpoons NH_4^+$$

A still more general concept is that of G. N. Lewis which defines a base as anything which has an unshared pair of electrons. Thus in the reaction



$$H^+ + :NH_3 \rightleftharpoons NH_4^+$$

the NH_3 is a base because it possesses an unshared pair of electrons. This latter concept explains many phenomena, such as the effect of certain substances other than hydrogen ions in the changing of the color of indicators. It also explains acids and bases in nonaqueous systems as liquid NH_3 and SO_2.

Beam (of energy) — The locus of all series of wave-fronts projected from the source and directed toward given objects or positions in space.

Beam splitter — A device to produce two separate beams from one incident beam. This can be done with prisms or halfsilvered mirrors.

Beat(s) — Two vibrations of slightly different frequencies f_1 and f_2 when added together, produce in a detector sensitive to both these frequencies, a regularly varying response which rises and falls at the "beat" frequency $f_b = |f_1 - f_2|$. It is important to note that a resonator which is sharply tuned to f_b alone will not resound at all in the presence of these two beating frequencies. See Combination Frequencies.

Beat frequencies — The beat of two different frequencies of signals on a nonlinear circuit when they combine or beat together. It has a frequency equal to the difference of the two applied frequencies.

Beating — A wave phenomenon in which two or more periodic quantities of different frequencies produce a resultant having pulsations of amplitude.

This process may be contolled to produce a desired beat frequency. See Heterodyne.

Beer's law — If two solutions of the same colored compound be made in the same solvent, one of which is, say, twice the concentration of the other, the absorption due to a given thickness of the first solution should be equal to that of twice the thickness of the second.

Mathematically this may be expressed $l_1c_1 = l_2c_2$ when the intensity of light passing through the two solutions is a constant and if the intensity and wave length of light incident upon each solution are the same.

Bel — The fundamental division of a lagarithmic scale for expressing the ratio of two amounts of power, the number of bels denoting such a ratio being the logarithm to the base 10 of this ratio.

With P_1 and Pli2 designating two amounts of power and N the number of bels denoting their ratio, $N = \log^{10}(P_1/P_2)$ bels.

Bernoulli law or Bernoulli theorem — (After Daniel Bernoulli, 1700—1782, Swiss scientist.) 1. In aeronautics, a law or theorem stating that in a flow of incompressible fluid the sum of the static pressure and the hynamic pressure along a streamline is constant if gravity and frictional effects are disregarded.

From this law is follows that where there is a velocity increase in a fluid flow there must be a corresponding pressure decrease. Thus an airfoil, by increasing the velocity of the flow over its upper surface, derives lift from the decreased pressure.

2. As originally formulated, a statement of the conservation of energy (per unit mass) for a nonviscous fluid in steady motion. The specific energy is composed of the kinetic energy $u^2/2$, where u is the speed of the fluid; the potential energy gz, where g is the acceleration of gravity and z is the height above an arbitrary reference level; and the work done by the pressure forces of a compressible fluid $\int v\,dp$, where p is the pressure, v is the specific volume, and the integration is always with respect to values of p and v on the same parcel. Thus, the relationship

$$\frac{v^2}{z} + gz + \int v\,dp = \text{Constant along a streamline}$$

is valid for a compressible fluid in steady motion, since the streamline is also the path. If the motion is also irrotational, the same constant holds for the entire fluid.

Berthelot principle of maximum work — Of all possible chemical processes which can proceed without the aid of external energy, that process always takes place which is accompanied by the greatest evolution of heat. This law holds good for low temperatures only and does not account for endothermic reations.

Beta (β)-particle, (Beta ray) — One of the particles which can be emitted by a radioactive atomic nucleus. It has a mass about 1/1837. that of the proton. The negatively charged beta particle is identical with the ordinary electron, while the positively charged type (positron) differs from the electron in having equal but opposite electrical properties. The emission of an electron entails the change of a neutron into a proton inside the nucleus. The emission of a positron is similarly associated with the change of a proton into a neutron. Beta particles have no independent existance inside the nucleus, but are created at the instant of emission. See Neutrino.

Betatron — An accelerator used to impart high velocities to electrons (beta particles). Propellant is an electromagnetic field. A five to six Mev betatron can produce X-rays equivalent to the gamma radiation of 10 to 20 g of radium.

Bevatron — A six or more billion electron volt accelerator of protons and other atomic particles. Makes use of a Cockcroft-Walton transformer cascade accelerator and a linear (q.v.) as well as an electromagnetic field in the build-up.

Binary notation — A system of positional notation in which the digits are coefficients of powers of the base 2 in same way as the digits in the conventional decimal system are coefficients of powers of the base 10.

Binary notation employs only two digits, 1 and 0, therefore is used extensively in computers where the on and off positions of a switch or storage device can represent the two digits.

In decimal notation 111 — $(1\times10^2)+(1\times10^1)+(1\times10^0) = 100+10+1$ = one hundred and eleven.

In binary notation 111 = $(1\times2^2)+(1\times2^1)+(1\times2^0) = 4+2+1$ = seven.

Balck body — If, for all values of the wave length of the incident radiant energy, all of the energy is absorbed the body is called a black body.

Bohr radius (symbol α°) — The smallest possible radius of an electron orbit in the Bohr model of the atom, 5.29167×10^9 cm.

Bohr's atomic theory — The theory that atoms can exist for a duration solely in certain states, characterized by definite electronic orbits, i.e., by definite energy levels of their extra-nuclear electrons, and in these stationary states they do not emit radiation; the jump of an electron from an orbit to another of a smaller radius is accompanied by monochromatic radiation.

Bolometer — An instrument which measures the intensity of radiant energy by employing a thermally sensitive electrical resistor; a type of actinometer. Also called actinic balance. Compare radiometer.

Two identical, blackened, thermally sensitive electrical resistors are used in a Wheatstone bridge circuit. Radiation is allowed to fall on one of the elements, causing a change in its resistance. The change is a measure of the intensity of the radiation.

Boltzmann constant (symbol k) — The ratio of the universal gas constant to Avogadro number; equal to 1.38054×10^{-16} erg/°K. Sometimes called gas constant per molecule, Boltzmann universal conversion factor.

Bouguer law — A relationship describing the rate of decrease of flux density of a plane-parallel beam of monochromatic radiation as it penetrates a medium which both scatters and absorbs at that wavelength. This law may be expressed

$$dI_\lambda = -\alpha_\lambda I_\lambda \, dx$$

or

$$I_\lambda = I_{\lambda 0} e^{-\alpha_\lambda x}$$

where I is the flux density of the radiation; α_λ is the attenuation coefficient (or extinction coefficient) of the medium at wavelength λ; $I_{\lambda o}$ is the flux density at the source; and x is the distance from the source. Sometimes called ~~Beer-law,~~ EER Lambert law of absorption. See Absorption coefficient, Scattering coefficient.

Boussinesq approximation — The assumption (frequently used in the theory of convection) that the fluid is incompressible except insofar as the thermal expansion produces a buoyancy, represented by a term $g\alpha T$, where g is the acceleration of gravity; α is the coefficient of thermal expansion; and T is the perturbation temperature.

Boyle's law for gases — At a constant temperature the volume of a given quantity of any gas varies inversely as the pressure to which the gas is subjected. For a perfect gas, changing from pressure p and volume v to pressure p′ and volume v′ without change of temperature,

$$pv = p'v'$$

Boyle-Mariotte law — The empirical generalization that for many so-called perfect gases, the product of pressure p and volume V is constnat in an isothermal process:

$$pV = F(T)$$

where the function F of the temperature T cannot be specified without reference to other laws (e.g., Charles-Gay-Lussac law). Also called Boyle law, Mariotte Law.

Brayton cycle — (After George B. Brayton, American engineer.) Same as Joule cycle.

Breakdown potential = dielectric strength.

Breeder, Reactor (Breeder pile) — A nuclear chain reactor in which transmutation produces a greater number of fissionable atoms than the number of parent atoms consumed.

Bremsstrahlung (German, braking radiation) — Electromagnetic radiation produced by the rapid change in the velocity of an electron or another fast, charged particle as it approaches an atomic nucleus and is deflected by it. See Bremsstrahlung effect.

Bremsstrahlung effect — The emission of electromagnetic radiation as a consequence of the acceleration of charged elementary particles, such as electrons, under the influence of the attractive or repulsive force fields of atomic nuclei near which the charged particle moves.

In cosmic-ray shower production, bremsstrahlung effects givve rise to emission of gamma rays as electrons encounter atmospheric nuclei. The emission of radiation in the bremsstrahlung effect is merely one instance of the general rule that electromagnetic radiation is emitted only when electric charges undergo acceleration.

Brewster window — An aperture through which light can enter into a new medium at an angle to the interface such that

$$\tan \theta_B = \frac{n_b}{n_a}$$

where θ_B is the Brewster angle. n_b and n_a are the indices of refraction of the media a and b, and light enters b from a.

Brewster's law — The tangent of the polarizing angle for a substance is equal to the index of refraction. The polarizing angle is that angle of incidence for which the reflected polarized ray is at right angles to the refracted ray. If n is the index of refraction and θ the polarizing angle, n = tan θ.

Brightness is measured by the flux emitted per unit emissive area as projected on a plane normal to the line of sight. The unit of brightness is that of a perfectly diffusing surface giving out one lumen per square centimeter of projected surface and is called the lambert. The millilambert (0.001 lambert) is a more convenient unit. Candle per square centimeter is the brightness of a surface which has, in the direction considered, a luminous intensity of 1 candle/cm².

British thermal unit — The quantity of heat required to raise the temperature of one pound of water 1°F at, or near, its point of maximum density (39.1°F). The Btu is equivalent to 0.252 kilogram-calorie or 1055 joules.

Brownlan movement — A continuous agitation of particles in a colloidal solution caused by unbalanced impacts with molecules of the surrounding medium. The motion may be observed with a microscope when a strong beam of light is caused to traverse the solution across the line of sight.

Bulk modulus — The modulus of volume elasticity,

$$M_B = \frac{p_2 - p_1}{\dfrac{v_1 - v_2}{v_1}}$$

where p_1, p_2; v_1, v_2 are the initial and final pressure and volume respectively. It is the reciprocal of the coefficient of compressibility.

Calorie — The amount of heat necessary to raise 1 g of water at 15°C, 1°C. There are various calories depending upon the interval chosen. Sometimes the unit is written as the gram-calorie or the kilogram calorie, the meaning of which is evident. The calorie may be defined in terms of its mechanical equivalent. The National Bureau of Standards defines the calorie as 4.18400 joules. At the International Steam Table Conference held in London in 1929 the international calorie was defined at 1/860 of the international watt hour, which makes it equal to 4.1860 international joules.

With the adoption of the absolute system of electrical units, this becomes 1/859.858 watt hours or 4.18674 joules. The Btu was defined at the same time as 251.996 international calories.

Calutron — An apparatus operating on the principle of the mass spectrograph and used for separating U^{235} from U^{238}.

Candela — The candela is the luminous intensity, in the direction of the normal, of a black body surface 1/600,000 m² in area, at the temperature of solidification of platinum under a pressure of 101,325 N/m².

Candle (new unit) — 1/60 of the intensity of 1 cm^2 of a blackbody radiator at the temperature of solidification of platinum (2045K).

Capacitance is measured by the charge which must be communicated to a body to raise its potential one unit. Electrostatic unit capacitance is that which requires one electrostatic unit of charge to raise the potential one electrostatic unit. The farad = 9×10^{11} electrostatic units. A capacitance of one farad requires one coulomb of electricity to raise its potential one volt. Dimensions, $[\varepsilon l]$; $[\mu^{-1} l^{-1} t^2]$.

A conductor charged with a quantity Q to a potential V has a capacitance,

$$C = \frac{Q}{V}$$

Capacitance of a spherical conductor of radius r,

$$C = Kr$$

Capacitance of two concentric spheres of radii r and r′

$$C = K \frac{rr'}{r - r'}$$

Capacitance of a parallel plate condenser, the area of whose plates is A and the distance between them d,

$$C = \frac{KA}{4\pi d}$$

Capacitances will be given in electrostatic units if the dimensions of condensers are substituted in centimeters. K is the dielectric constant of the medium.

Capillary constant or specific cohesion,

$$a^2 = \frac{2T}{(d_1 - d_2)g} = hr$$

where T is surface tension, d_1 and d_2, the densities of the two fluids, g the acceleration due to gravity, h the height of rise in a capillary tube of radius r. See Surface tension.

Carbon cycle — A sequence of atomic nuclear reactions and spontaneous radioactive decay which serves to convert matter into energy in the form of radiation and high-speed particles, and which is regarded as one of the principal sources of the energy of the sun and other similar stars.

This cycle, first suggested by Bethe in 1938, gets its name from the fact that carbon plays the role of a kind of catalyst in that it is both used by and produced by the reaction, but is not consumed itself. Four protons are, in net, converted into an alpha particle and two positrons (with accompanying neutrinos); and three gamma-ray emissions are emitted directly in addition to the two gamma emissions that ensue from annihilation of the positrons by ambient electrons. This cycle sets in at stellar interior temperatures of the order of 5 million degrees Kelvin.

An even simpler reaction, the proton-proton reaction, is also believed to occur within the sun and may be of equal or greater importance.

Carnot cycle — An idealized reversible thermodynamic cycle. The Carnot cycle consists of four stages: (a) an isothermal expansion of the gas at temperature T_1; (b) an adiabatic expansion to temperature T_2; (c) an isothermal compression at temperature T_2; (d) an adiabatic compression to the original state of the gas to complete the cycle. See Carnot engine, Thermodynamic efficiency.

In a Carnot cycle, the net work done is the difference between the heat input Q_1 at higher temperature T_1 and the heat extracted Q_2 at the lower temperature T_2.

Carnot engine — An idealized reversible heat engine working in a Carnot cycle. It is the most efficient engine that can operate between two specified temperatures; its efficiency is equivalent to the thermodynamic efficiency. The Carnot engine is capable of being run either as a conventional engine or as a refrigerator.

Cassegrain telescope — A reflecting telescope in which a small hyperboloidal mirror reflects the convergent beam from the paraboloidal primary mirror through a hole in the primary mirror to an eyepiece in back of the primary mirror. Also called Cassegrainian telescope, Cassegrain. See Newtonian Telescope.

Catalytic agent — A substance which by its mere presence alters the velocity of a reaction, and may be recovered unaltered in nature or amount at the end of the reaction.

Cathode — The electrode at which reduction occurs. It is the negative electrode in a cell through which current is being forced, but it is the positive pole of a battery. In a vacuum tube, the cathode is the electrode from which electrons are liberated. See Anode.

Cation — A positively charged ion.

Cauchy's dispersion formula —

$$n = A + \frac{B}{\lambda^2} + \frac{C}{\lambda^4} + \ldots$$

An empirical expression giving an approximate relation between the refractive index n of a medium and the wavelength λ of the light; A, B, and C being constants for a given medium.

Celsius — See Temperature, Celsius, in this section.

CENTI — A prefix meaning 1/100 or 10^{-2}. Symbol is c.

Centigrade temperature scale (abbr. C) — A temperature scale with the ice point at 0° and the boiling point of water at 100°. Now called Celsius temperature scale.

Conversion to the Fahrenheit temperature scale is according to the formula

$$°C = 5/9\ (°F - 32)$$

where t is temperature; v is volume; and c is a coefficient of thermal expansion independent of the particular gas. If the centigrade temperature scale is used and v_o is the volume at 0°C, then the value of the constant c is approximately 1/273. Also called Charles law, Gay-Lussac law.

Centipoise — A standard unit of viscosity, equal to 0.01 poise, the c.g.s. unit of viscosity. Water at 20°C has a viscosity of 1.002 centipoise or 0.01002 poise.

Centripetal force — The force required to keep a moving mass in a circular path. Centrifugal force is the name given to the reaction against centripetal force.

Chain reaction — In general, any self-sustaining process, whether molecular or nuclear, the products of which are instrumental in, and directly contribute to the propagation of the process. Specifically, a fission chain reaction, where the energy liberated or particles produced (fission products) by the fission of an atom cause the fission of other atomic nuclei, which in turn propagate the fission reaction in the same manner.

Charles-Gay-Lussac law — An empirical generalization that in a gaseous system at constant pressure, the temperature increase and the relative volume increase stand in approximately the same proportion for all so-called perfect gases. Mathematically,

$$t - t_0 = (1/c\ [(v - v_0)/v_0]$$

Charles law = Charles-Gay-Lussac law.

Chemiluminescence — Emission of light during a chemical reaction.

Christiansen effect — When finely powdered substances, such as glass or quartz, are immersed in a liquid of the same index of refraction complete transparency can only be obtained for monochromatic light. If white light is employed the transmitted color corresponds to the particular wave-length for which the two substances, solid and liquid have exactly the same index of refraction. Due to differences in dispersion the indices of refraction will match for only a narrow band of the spectrum.

Chromatic aberration — Due to the difference in the index of refraction for different wave lengths, light of various wave lengths from the same source cannot be focused at a point by a simple lens. This is called chromatic aberration.

Circularly polarized wave — An electromagnetic wave for which the electric or the magnetic field vector, or both, at a point describe a circle.

This term is usually applied to transverse waves.

Circular mil — The area of a circle with a diameter of 0.001 in, a unit used

for the measurement of small circular areas, such as the cross section of a wire.
One circular mil = 7.85×10^{-7} in^2.

Circular polarization — The polarization of a wave radiated by a constant electric vector rotating in a plane so as to describe a circle. See Elliptical polarization.

Circulation — 1. The flow or motion of a fluid in or through a given area or volume. 2. A precise measure of the average flow of fluid along a given closed curve. Mathema tically, circulation is the line integral.

$$\oint v \cdot dr$$

about the closed curve, where v is the fluid velocity, and dr is a vector element of the curve.

By Stokes theorem, the circulation about a plane curve is equal to the total vorticity of the fluid enclosed by the curve.

The given curve may be fixed in space or may be defined by moving fluid parcels.

Circulation integral — The line integral of an arbitrary vector taken around a closed curve. Thus,

$$\oint a \cdot dr$$

is the circulation integral of the vector a around the closed curve; dr is an infinitesimal vector element of the curve. If the vector is the velocity, this integral is called the circulation.

Clapeyron-Clausius equation — The differential equation relating pressure to temperature in a system in which two phases of a substance are in equilibrium.

$$dp/dT = L/(T\Delta V)$$

where p is pressure; T is temperature; L is the latent heat of the phase change; and ΔV is the differenc in volume of the phases. Also called Clapeyron equation, Clausius-Clapeyron equation.

Clausius-Clapeyron equation = Clapeyron-Clausius equation.

Cloud chamber — An apparatus containing moist air or other gas which on sudden expansion condenses moisture to droplets on dust particles or other nuclei. Thus charged particles or ions in the space become nuclei and their numbers and behavior, when properly illuminated, may be studied.

Coefficient of compressibility — The relative decrease of the volume of a gaseous system with increasing pressure in an isothermal process. This coefficient is

$$-(1/V)\,(\partial V/\partial p)_T$$

where V is the volume; p is the pressure; and T is the temperature. The reciprocal of this quantity is the bulk modulus. Also called compressibility. Compare coefficient of thermal expansion, coefficient of tension.

Coefficient of tension — The relative increase of pressure of a system with increasing temperature in an isochoric process. In symbols this quantity is

$$(l/p)\,(\partial p/\partial T)_V$$

where p is pressure; T is temperature; and V is volume. Compare coefficient of compressibility, coefficient of thermal expansion.

Coefficient of thermal expansion — The ratio of the change of length per unit length (linear), or change of volume per unit volume (volumninal), to the change of temperature.

Coherence length — The maximum tolerable optical path length difference between two energy beams which are forming an interference pattern. This will vary with the degree of spectral purity of the source producing the beams. For example a perfect monochromatic source would have an infinite coherence length.

Coherent (additon) — The vector addition of both the amplitude and phases of different waves of the same frequency at a given time or at a given position.

Coherent oscillator (abbr. Coho) — An oscillator which provides a reference by which the radio frequency phase difference of successive received pulses may be recognized. See Coherent reference.

Coherent reference — The reference signal, usually of stable frequency, to which other signals are phase-locked to establish coherence throughout a system.

Coherent (source) — A source radiating coherent waves.

Coherent (waves) — Waves whose frequencies are equal and whose phases are related to each other at a given time or at a given place in space. Coherence can be of two types, temporal and spatial.

Cold working — Deforming metal plastically at a temperature lower than the recrystallization temperature.

Colligative property — A property numerically the same for a group of substances, independent of their chemical nature.

Colloid — A phase dispersed to such a degree that the surface forces become an important factor in determining its properties.

In general particles of colloidal dimensions are approximately 10Å to 1 μm in size. Colloidal particles are often best distinguished from ordinary molecules due to the fact that colloidal particles cannot diffuse through membranes which do allow ordinary molecules and ions to pass freely.

Colloidal system — An intimate mixture of two substances one of which, called the dispersed phase (or colloid) is uniformly distributed in a finely divided state through the second substance, called the dispersion medium (or dispersing medium). The dispersion medium may be a gas, a liquid, or a solid, and the dispersed phase may also be any of these, with the exception that one does not speak of a colloidal system of one gas in another. Also called colloidal dispersion, colloidal suspension.

A system of liquid or solid particles colloidally dispersed in a gas is called an aerosol. A system of solid substance or water-insoluble liquid colloidally dispersed in liquid water is called a hydrosol. There is no sharp line of demarcation between true solutions and colloidal systems on the one hand, or between mere suspensions and colloidal systems on the other. When the particles of the dispersed phase are smaller than about 1 millimicron in diameter, the system begins to assume the properties of a true solution; when the particles dispersed are much greater than 1 μm, separation of the dispersed phase from the dispersing medium becomes so rapid that the system is best regarded as a suspension.

Coma — An aberration of spherical lenses, occurring in the case of oblique incidence, when the bundle of rays forming the image is unsymmetrical. The image of a point is comet shaped, hence the name.

Combination frequencies — Two vibrations of arbitrary frequencies f_1 and f_2 when applied simultaneously to a nonlinear (distorting) device will excite it to a motion containing not only the original frequencies, but also members of a set of "combination" set of frequencies given by $f_o = mf_1 + nf_2$ where m and n are integers. A resonator sharply tuned to any one of these frequencies which may be produced in the nonlinear device will resound to it with an amplitude depending on the type of nonlinearity. The superheterodyne radio receiver depends on this phenomenon.

Combining volumes — Under comparable conditions of pressure and temperature the volume ratios of gases involved in chemical reactions are simple whole numbers.

Combining weight of an element or radical is its atomic weight divided by its valence.

Combining weights, law of — If the weights of elements which combine with each other be called their "combining weights," then elements always combine either in the ratio of their combining weights or of simple multiples of these weights.

Compensation Point — The temperature (below the Néel Point) at which, in some ferrimagnetic compounds, the saturation magnetization becomes zero.

Complementary color — Either of a pair of spectrum colors that when combined give a white or nearly white light.

Component substances, law of — Every material consists of one substance, or is a mixture of two or more substances, each of which exhibits a specific set of properties, independent of the other substances.

Compounds are substances containing more than one constituent element and having properties, on the whole, different from those which their constituents had as elementary substances. The composition of a given pure compound is perfectly definite, and is always the same no matter how that compound may have been formed.

Compressibility — Reciprocal of the bulk modulus.

Compton effect, (Compton recoil effect) — Elastic scattering of photons by electrons results in decrease in frequency and increase of wave length of X-rays and gamma-rays when scattered by free electrons.

Compton electron — An orbital electron of an atom which has been ejected from its orbit as a result of an impact by a high-energy quantum of radiation (X-ray or gamma-ray). Also called Compton recoil electron.

Compton wavelength (symbol λ_c) — Of a particle, the distance h/mc, where h is the Planck constant, m is the mass of the particle, and c is the velocity of light.

The Compton wavelength of the electron (symbol λ_c) is 2.4261×10^{-10} centimeter; of the proton (symbol $\lambda_{c,p}$) is 1.32140×10^{-13} centimeter.

Computer-generated holograms — A hologram made synthetically and based on computer calculations of amplitude and/or phase.

Concentration — The amount of a substance in weight, moles, or equivalents contained in unit volume.

Condensers in parallel and series — If c_1, c_2, c_3, etc. represent the capacitances of a series of condensers and C their combined capacitance,

when in parallel,

$$C = c_1 + c_2 + c_3 \ldots$$

when in series,

$$\frac{1}{C} = \frac{1}{c_1} + \frac{1}{c_2} + \frac{1}{c_3} \ldots$$

Conductance — The reciprocal of resistance, is measured by the ratio of the current flowing through a conductor to the difference of potential between its ends. The practical unit of conductance, the mho, the conductance of a body through which one ampere of current flows when the potential difference is one volt. The conductance of a body in mho is the reciprocal of the value of its resistance in ohms. Dimensions, $[\varepsilon\, l\, t^{-1}]$. $[\mu^{-1}\, l^{-1}\, t]$.

Conductivity, electrical, is measured by the quantity of electricity transferred across unit area, per unit potential gradient per unit time. Reciprocal of resistivity. Volume conductivity or specific conductance, $k = 1/\varrho$ where ϱ is the volume resistivity. Mass conductivity = k/d where d is density. Equivalent conductivity A = k/c where c is the number of equivalents per unit volume of solution. Molecular conductivity $\mu = k/m$ where m is the number of moles per unit volume of solution. Dimensions: volume conductivity, $[\varepsilon\, t^{-1}]$; $[\mu^{-1}\, l^{-2}\, t]$, mass conductivity, $[\varepsilon\, m^{-1}\, l^3\, t^{-1}]$; $[\mu^{-1}\, m^{-1}\, lt]$.

Conductivity, thermal — Time rate of transfer of heat by conduction, through unit thickness, across unit area for unit difference of temperature. It is measured as calories per second per square centimeter for a thickness of one centimeter and a difference of temperature of 1°C.

If the two opposite faces of a rectangular solid are maintained at temperatures t_1 and t_2 the heat conducted across the solid of section a and thickness d in a time T will be,

$$Q = \frac{K\,(t_2 - t_1)aT}{d}$$

K is a constant depending on the nature of the substance, designated as the specific heat conductivity. K is usually given for Q in calories, t_1 and t_2 in °C, a in cem², T in sec, and d in cm. See Heat conductivity.

Conductors — A class of bodies which are incapable of supporting electric strain. A charge given to a conductor spread to all parts of the body.

Conjugate foci — Under proper conditions light divergent from a point on or near the axis of a lens or spherical mirror is focused at another point. The point of convergence and the position of the source are interchangeable and are called conjugate foci.

Conservation of energy — The principle that the total energy of an isolated system remains constant if no interconversion of mass and energy takes place.

This principle takes into account all forms of energy in the system; it therefore provides a constraint on the conversions from one form to another.

Conservation of energy, law of — Energy can neither be created nor destroyed and therefore the total amount of energy in the universe remains constant.

Conservation of mass — In all ordinary chemical changes, the total of the reactants is always equal to the total mass of the products.

Conservation of momentum, law of — For any collision, the vector sum of the momenta of the colliding bodies after collison equal the vector sum of their momenta before collision. If two bodies of masses m_1 and m_2 have, before impact velocities v_1 and v_2 and after impact velocities u_1 and u_2

$$m_1 u_1 + m_2 u_2 = m_1 v_1 + m_2 v_2$$

Constant of aberration — The maximum aberration of a star observed from the surface of the earth, 20.49 sec of arc.

The maximum occurs at the time the direction of motion of the earth in its orbit is at right angles to a line from the earth to the star.

Constitutive property — A property which depends on the constitution or structure of the molecule.

Contrast of fringes — The relative difference between the brightness or density of successive bright and dark fringes on a hologram or interferogram.

Cooling — Processing highly radioactive materials to attain lesser radioactivity for subsequent use or handling.

Coriolis acceleration — An acceleration of a particle moving in a relative coordinate system. The total acceleration of the particle, as measured in an inertial coordinate system, may be expressed as the sum of the acceleration within the relative system, the acceleration of the relative system itself, and the coriolis acceleration.

Physically, coriolis acceleration may be considered as coming from the conservation of momentum in a body moving in a direction not parallel to the axis of rotation of the relative system.

Mathematically, coriolis acceleration comes from the differentiation of terms containing the angular velocity ω in the expression for the absolute velocity of the particle.

In the case of the earth, moving with angular velocity ω, a particle moving relative to the earth with velocity v has the coriolis acceleration $2\omega \times v$. If Newton laws are to be applied in the relative system, the coriolis acceleration and the acceleration of the relative system must be treated as forces.

Cosmic rays — Highly penetrating radiations which strike the earth, assumed to originate in interstellar space. They are classed as: primary, coming from the assumed source, and secondary, those induced in upper atmospheric nuclei by collisions with primary cosmic rays.

Cosmotron — A particle accelerator capable of giving them energies to billions of electron volts.

Couette flow — The shearing flow of a fluid between two parallel surfaces in relative motion. A two-dimensional steady flow without pressure gradient in the direction of flow and caused by the tangential movement of the bounding surfaces. The only practical type is the flow between concentric rotating cylinders (as of the oil in a cylindrical bearing).

Counterradiation — The downward flux of atmospheric radiation passing through a given level surface, usually taken as the earth's surface. Also called back radiation.

This result of infrared (long-wave) absorption and reemission by the atmosphere is the principal factor in the greenhouse effect.

Coulomb (unit of quantity of electricity) — the quantity of electricity transported in 1 sec by a current of 1 A. A unit quantity of electricity. It is the quantity of electricity which must pass through a circuit to deposit 0.0011180 g of silver from a solution of silver nitrate. An ampere is 1 coulomb/sec. A coulomb is also the quantity of electricity on the positive plate of a condenser of one-farad capacity when the electromotive force is 1 v.

Couple — Two equal and oppositely directed parallel but not colinear forces acting upon a body form a couple. The moment of the couple or torque is given by the product of one of the forces by the perpendicular distance between them. Dimension, $[m\, l^2\, t^{-2}]$.

Couple acting on a magnet of magnetic moment ml in a field of strength H. If the magnet is perpendicular to the direction of the field

$$C = Hml = HM$$

If the angle between the magnet and the field is θ

$$C = Hml \sin \theta$$

The couple will be in dyn-cm for cgs electromagnetic units of H, m and l.

Critical mass — The minimum mass the fissile material must have in order to maintain a spontaneous fission chain reaction. For pure U^{235} it is computed to be about 20 lb.

Critical point — The thermodynamic state in which liquid and gas phases of a substance coexist in equilibrium at the highest possible temperature. At higher temperatures than the critical no liquid phase can exist. For water substance the critical point is

$$P_s = 2.21 \times 10^5 \text{ mbar}$$
$$T = 647°K$$
$$v = 3.10 \text{ g/cm}^3$$

where P_s is the saturation vapor pressure of the water vapor; T is the Kelvin temperature; and v is the specific volume.

Critical temperature — 1. The temperature above which a substance cannot exist in the liquid state, regardless of the pressure. 2. As applied to materials, the temperature at which a change in phase takes place causing an appreciable change in the properties of the material.

Cross section (Nuclear cross section) — A measure of the probability of a particular process. The nuclear cross section is expressed by a/bc, where a is the number of processes occurring, b the number of incident particles, and c the number of target nuclei per cm^2. Thereare nuclear cross sections for fission, for slow neutron capture, for Compton collision, and for ionization by electron impact.

Crossed polarizer — A dual polarization filter and transducer which transforms varying orientations of polarized waves into an amplitude output.

Cryohydrate — The solid which separates when a saturated solution freezes. It contains the solvent and the solute in the same proportions as they were in the saturated solution.

Cryopumping — The process of removing gas from a system by condensing it on a surface maintained at very low temperatures.

Cryotron — A device based upon the principle that superconductivity established at temperatures near absolute zero is destroyed by the application of a magnetic field.

Crystal — The "ideal crystal" is a homogeneous portion of crystalline matter, (q.v.) whether bounded by faces or not.

Crystalline matter is matter that possesses a triperiodic structure on the atomic scale. It is characterized by discontinuous vectorial properties that give rise to "crystal planes" [(1) crystal growth (faces); (2) cohesion (cleavage planes); (3) twinning (twin planes); (4) gliding (gliding planes); (5) X-ray, electron, or neutron diffraction ("reflecting" planes); all of which are parallel to lattice planes.]

Curie — The curie is the SI unit rate of radioactive decay; the quantity of any radioactive nuclide which undergoes 3.7×10^{10} disintegrations/sec. The symbol for this unit is Ci. 1 Ci = 3.7×10^{10} Bq.

Curie's law — The intensity of magnetization,

$$I = \frac{AH}{T}$$

where H, is the magnetic field strength, T the absolute temperature and A Curie's constant. Used for paramagnetic substances.

Curie point — All ferro-magnetic substances have a definite temperature of transition at which the phenomena of ferro-magnetism disappear and the substances become merely paramagnetic. This temperature is called the "Curie Point" and is usually lower than the melting point.

Curie-Weiss law — The Curie law was modified by Weiss to state that the susceptibility of a paramagnetic substance above the Curie point varies inversely as the excess of the temperature above that point.

This law is not valid at or below the Curie point.

Current (electric) — The rate of transfer of electricity. The transfer at the rate of one electrostatic unit of electricity in one second is the electrostatic unit of current. The electromagnetic unit of current is a current of such strength that one centimeter of the wire in which it flows is pushed sideways with a force of 1 dyn when the wire is at right angles to a magnetic field of unit intensity. The practical unit of current is the ampere, a transfer of one coulomb per second, which is one tenth the electromagnetic unit. The international ampere is the unvarying electric current which, when passed through a solution of silver nitrate in accordance with certain specifications, deposits silver at the rate of 0.00111800 g/sec. The international ampere is equivalent to 0.999835 absolute ampere. The ampere-turn is the magnetic potential produced between the two faces of a coil of one turn carrying one ampere. Dimensions, $[\varepsilon^{1/2}\, m^{1/2}\, l^{1/2}\, t^{-2}]$; $[\mu^{-1/2}\, m^{1/2}\, l^{1/2}\, t^{-1}]$.

Current in a simple circuit — The current in a circuit including an external resistance R and a cell of electromotive force E and internal resistance,

$$I = \frac{E}{R + r}$$

If E is in volts and r and R in ohms the current will be in amperes.

For two cells in parallel,

$$I = \frac{E}{R + \frac{r}{2}}$$

For two cells in series,

$$I = \frac{2E}{R + 2r}$$

CW laser — Continuous wave laser — a laser that radiates its energy in an uninterpreted beam.

Cyclotron — The magnetic resonance accelerator for imparting very great velocities to heavier nuclear particles without the use of excessive voltages.

Dalton = atomic mass unit.

Dalton's law of partial pressures — The pressure exerted by a mixture of gases is equal to the sum of the separate pressures which each gas would exert if it alone occupied the whole volume. This fact is expressed in the following formula:p

$$PV = V(p_1 + p_2 + p_3, \text{etc.})$$

Day — 1. The duration of one rotation of the earth, or another celestial body, on its axis.

A day is measured by successive transits of a reference point on the celestial sphere over the meridian, and each type takes its name from the reference used. Thus, for a solar day the reference is the sun; a mean solar day if the mean sun; and an apparent solar day if the apparent sun. For a lunar day the reference is the moon for a sidereal day the vernal equinox; for a constituent day an astre fictif or fictitious star. The expression lunar day refers also to the duration of one rotation of the moon with respect to the sun. A Julian day is the consecutive number of each day, beginning with January 1, 4317 BC.

2. A period of 24 hr beginning at a specified time, as the civil day beginning at midnight, or the astronomical day beginning at noon.

DeBroglie wavelength — In quantum mechanics, a wavelength (λ) attributed to a particle by virtue of its momentum. In general

$$\lambda = h/mv = \frac{h}{m_0 v} \sqrt{\frac{1 - v^2}{c^2}},$$

where m is the observed mass of the particle, m_o is its rest mass, v is its velocity, c is the velocity of light, and h is Planck's constant.

Debye-Falkenhagen effect — The increase in the conductance of an electrolytic solution produced by alternating currents of sufficiently high frequencies over that observed with low frequencies or with direct current.

Debye length — A theoretical length which describes the maximum separation at which a given electron will be influenced by the electric field of a given positive ion. Sometimes referred to as the Debye shielding distance or plasma length.

It is well known that charged particles interact through their own electric fields. In addition, Debye has shown that the attractive force between an electron and ion which would otherwise exist for very large separations is indeed cut off for a critical separation due to the presence of other positive and negative charges in between. This critical separation or Debye length decreases for increased plasma density.

Decay — Diminution of a radioactive substance due to nuclear emission of alpha or beta particles, gamma rays or positrons.

Decay constant — 1. = attenuation constant. 2. (symbol λ) A constant relating the instant rate of radioactive decay of a radioactive species to the number of atoms N present at a given time t. Thus,

$$-(\partial N/\partial t) = \lambda N$$

If N_o is the number of atoms present at time zero then

$$N = N_0 e^{\ \lambda t}$$

Decay product — A nuclide resulting from the radioactive disintegration of a radionuclide, being formed either directly or as the result of succssive transformations in a radioactive series. Also called daughter, daughter element.

A decay product may be either radioactive or stable.

Deci — A prefix meaning one tenth or 10^{-1}. Symbol is d.

Decibel (abbr. db) — 1. A dimensionless measure of the ratio of two powers, equal to 10 times the logarithm to the base 10 of the ratio of two powers P_1/P_2. One tenth of a bel.

The power P_2 may be some reference power; in electricity, the reference power is sometimes taken as 1 milliwatt (abbr. dbm); in acoustics, the decibel is often taken as 20 times the common logarithm of the sound pressure ratio, with the reference pressure as 0.0002 dyn/cm².

Declination — 1. (symbol δ) Angular distance north or south of the celestial equator; the arc of an hour circle between the celestial equator and a point on the celestial sphere, measured northward or southward from the celestial equator through 90°, and labeled N or S to indicate the direction of measurement. 2. (symbol D) Magnetic declination. See Equatorial system.

Decomposition is the chemical separation of a substance into two or more substances, which may differ from each other and from the original substances.

Definite proportions, law of — In every sample of each compound substance the proportions by weight of the constituent elements are always the same.

Degree — Angle subtended at the center by a circular arc which is 1/360 of the circumference.

Degree of association $(1 - \alpha)$ — The degree of association of an electrolytic solution is the percentage of ions associated into nonconducting species, such as ion-pairs.

Degree of dissociation (or ionization) in general, α — The degree of dissociation (or ionization) of an electrolytic solution is the percentage of solute (or electrolyte) in the dissociated (or ionized) state in solution. Classically this degree is obtained from conductance measurements from the ratio, Λ/Λ_f where Λ_f is the equivalent conductance an electrolytic solution would have at some finite concentration if it were completely dissociated into ions at that concentration if it were completely dissociated into ions at that concentration. (See ionogens). This symbol is also used to denote the fraction of free ions in a solution when simple ions, ion pairs, and clusters higher than ion pairs are present. (See ionophores).

Degree of freedom — The number of the variables determining the state of a system (usually pressure, temperature, and concentrations of the components) to which arbitrary values can be assigned.

Deka — A prefix meaning ten or 10^1. Symbol is da.

Delayed neutrons — Neutrons emitted by excited nuclei in a radioactive process, so called because they are emitted an appreciable time after the fission. Compare prompt neutrons.

Delta ray — 1. An electron ejected by recoil when a rapidly moving alpha particle or other charged particle passes through matter. 2. By extension any secondary ionizing particle ejected by recoil when a primary particle passes through matter.

Density — Concentration of matter, measured by the mass per unit volume. Dimensions, $[m\,l^{-3}]$.

Density (of film) — The logarithm of the reciprocal of the optical transmission of the film.

Depletion layer — In a semiconductor, a region in which the mobile carrier charge density is insufficient to neutralize the net fixed charge density of donors and acceptors. Also called barrier.

Detenation wave — A shock wave in a combustible mixture, which originates as a combustion wave.

Deuterium (symbol D, d) — A heavy isotope of hydrogen having one proton and one neutron in the nucleus.

The symbol D is often used to designate deuterium in compounds, as HDO for molecules of that composition. Official chemical nomenclature uses the designation d with a number which designates the carbon atom to which the deuterium is bound; e.g., 2-d propane designates CH_3CHDCH_3.

Deuteron — Nucleus of the deuterium atom or the ion of deuterium. Its structure — one neutron and one proton.

Dewpoint — The temperature to which a given parcel of air must be cooled at constant pressure and constant water-vapor content in order for saturation to occur; the temperature at which the saturation vapor pressure of the parcel is equal to the actual vapor pressure of the contained water vapor. Any further cooling usually results in the formation of dew or frost. Also called dewpoint temperature.

When this temperatue is below 0°C, it is sometimes called the frost point.

Diabatic process — A process in a thermodynamic system in which there is a transfer of heat across the boundaries of the system.

Diabatic process is preferred to nonadiabatic process.

Diamagnetic materials — Are those within which an externally applied magnetic field is slightly reduced because of an alteration of the atomic electron orbits produced by the field. Diamagnetism is an atomic-scale consequence of the Lenz law of induction. The permeability of diagmagnetic materials is slightly less than that of empty space.

Dielectric — A material having a relatively low electrical conductivity; an insulator; a substance that contains few or no free electrons and which can support electrostatic stresses. The principal properties of a dielectric are its dielectric constant (the factor by which the electric field strength in a vacuum exceeds that in the dielectric for the same distribution of charge), its dielectric loss (the amount of energy it dissipates as heat when placed in a varying electric field), and its dielectric strength (the maximum potential gradient it can stand without breaking down).

In an electromagnetic field, the centers of the nonpolar molecules of a dielectric are displaced, and the polar molecules become oriented close to the field. The net effect is the appearance of charges at the boundaries of the dielectric. The frictional work done in orientation absorbs energy from the field which appears as heat. When the field is removed the orientation is lost by thermal agitation and so the energy is not regained. If free-charge carriers are present they too can absorb energy.

A good dielectric is one in which the absorption is a minimum. A vacuum is the only perfect dielectric. The quality of an imperfect dielectric is its dielectric strength; and the accumulation of charges within an imperfect dielectric is termed dielectric absorption.

Dielectric constant (symbol ε) — for a given substance, the ratio of the capacity of a condenser with that substance as dielectric to the capacity of the same condenser with a vacuum for dielectric. It is a measure, therefore, of the amount of electrical charge a given substance can withstand at a given electric field strength; it should not be confused with dielectric strength.

The dielectric constant ε is a function of temperature and frequency and is wirtten as a complex quantity

$$\epsilon = \epsilon' - i\epsilon''$$

where ϵ' is the part that determines the displacement current and ϵ'' the dielectric absorption (see dielectric). For a nonabsorbing, nonmagnetic material ϵ' is equal to the square of the index of refraction and the relation holds only at the particular frequency where these conditions apply.

$$F = \frac{QQ'}{\epsilon r'}$$

where F is the force of attraction between two charges Q and Q′ separated by a distance r in a uniform medium.

Dielectrics or insulators or nonconductors — A class of bodies supporting an electric strain. A charge on one part of a nonconductor is not communicated to any other part.

Dielectric strength — A measure of the resistance of a dielectric to electrical breakdown under the influence of strong electric fields; usually expressed in volts per centimeter. Sometimes called breakdown potential.

Diffraction — That phenomena produced by the spreading of waves around and past obstacles which are comparable in size to their wavelength.

Diffraction efficiency — Ratio of energy projected into the reconstructed image to the energy illuminating the hologram.

Diffraction fanning — The fanning out of a light or energy beam as it pours through a very narrow aperture (opening).

Diffraction grating — If s is the distance between the rulings, d the angle of diffraction, then the wave length where the angle of incidence is 90% is (for the nth order spectrum),

$$\lambda = \frac{s \sin d}{n}$$

If i is the angle of incidence, d the angle of diffraction, s the distance between the rulings, n the order of the spectrum, the wave length is,

$$\lambda = \frac{s}{n} (\sin i + \sin d).$$

A mask or special aperture used to break up a white light beam or composite energy beam into its various spectral components through the mechanism of diffraction.

Diffuse reflection — Scattering at all angles from the point of reflection.

Diffuse sky radiation — Solar radiation reaching the earth's surface after having been scattered from the direct solar beam by molecules or suspensoids in the atmosphere. Also called the skylight, diffuse skylight, sky radiation.

Of the total light removed from the direct solar beam by scattering in the atmosphere (approximately 25% of the incident radiation), about two-thirds ultimately reaches the earth as diffuse sky radiation.

Diffusion — If the concentration (mass of solid per unit volume of solution) at one surface of a layer of liquid is d_1 and at the other surface d_2, the thickness of the layer h and the area under consideration A, then the mass of the substance which diffuses through the cross-section A in time t is,

$$m = \Delta A \frac{(d_2 - d_1)t}{h}$$

where Δ is the coefficient of diffusion.

Diffusion Coefficient — If the concentration (mass of solid per unit volume of solution) at one surface of a layer of liquid is d_1, and at the other surface d_2, the thickness of the layer is h, the area under consideration is A, and the mass of a given substance which diffuses through the cross section A in time t is m, then the diffusion coefficient is defined as

$$D = \frac{mh}{A(d_2 - d_1)t}$$

Diffusivity — A measure of the rate of diffusion of a substance, expressed as the diffusivity coefficient K. When K is constant, the diffusion equation is

$$\frac{\partial q}{\partial t} = K \nabla^2 q$$

where q is the substance diffused; ∇^2 is the Laplacian operator; and t is time. The diffusivity has dimensions of a length times a velocity; it varies with the property diffused, and for any given property it may be considered a constant or a function of temperature, space, etc., depending on the context. Also called coefficient of diffusion. See conductivity, kinematic viscosity, exchange coefficients.

In the case of molecular diffusion the length dimension is the mean free path of the molecules. By analogy, in eddy diffusion, length becomes the mixing length. The coefficient is then called the eddy diffusivity, and is in general several orders of magnitude larger than the molecular diffusivity.

Diffusivity of heat — is given by Δ in the equation

$$\frac{dH}{dt} = -\Delta sd \frac{dT}{dx} dy\, dz$$

where dH is the quantity of heat passing through the area dy dz in the direction of x in a time dt. The rate of variation of temperature along x is given by dT/dx, s is specific heat and d, density. Dimensions, $[l^2 t^{-1}]$.

Dimensional formulae — If mass, length, and time are considered fundamental quantities, the relation of other physical quantities and their units to these three may be expressed by a formula involving the symbols l-m and t respectively, with appropriate exponents. For example; the dimensional formula for volume would be expressed, $[l^3]$; velocity, $[t^{-1}]$; force $[mlt^{-2}]$. Other fundamental quantities used in dimensional formulae may be indicated as follows: θ, temperature, ε the dielectric constant of a vacuum; μ, the magnetic permeability of a vacuum.

Diminution of pressure at the side of a moving stream — If a fluid of density d moves with a velocity v, the dimunution of pressure due to the motion is (neglecting viscosity),

$$p = \tfrac{1}{2} dv^2$$

Dip — The angle measured in a vertical plane between the direction of the earth's magnetic field and the horizontal.

Dipole — (1) A combination of two electrically or magnetically charged particles of opposite sign which are separated by a very small distance. (2) Any system of charges, such as a circulating current, which has the properties that: (a) no forces act on it in a uniform field; (b) a torque proportional to sin θ, where θ is the angle between the dipole axis and a uniform field, does act on it; (c) it produces a potential which is proportional to the inverse square of the distance from it.

Dipole moment — A mathematical entity; the product of one of the charges of a dipole unit by the distance separating the two dipolar charges. In terms of the definition of a dipole (2), the dipole moment p is related to the torque T, and the field strength E (or B) through the equation:

$$T = p \times E$$

Dipole moment, molecular — It is found from measurements of dielectric constant (i.e. by its temperature dependence, as in the Debye equation for total polarization) that certain molecules have permanent dipole moments. These moments are associated with transfer of charge within the molecule and provide valuable information as to the molecular structure.

Directly ionizing particles — are charged particles (electrons, protons, alpha particles, etc.) having sufficient kinetic energy to produce ionization by collision.

Direct solar radiation — In actinometry, that portion of the radiant energy received at the instrument direct from the sun, as distinguished from diffuse sky radiation, effective terrestrial radiation, or radiation from any other source. See global radiation.

Direct solar radiation is measured by pyrheliometers.

Dispersion — The difference between the index of refraction of any substance for any two wave lengths is a measure of the dispersion for these wave lengths, called the coefficient of dispersion.

Dispersion forces — The force of attraction between molecules possessing no permanent dipole. The interaction energy is given by

$$U_D = -\frac{3}{4} h \frac{V_0 \alpha^2}{r^6}$$

where h is Planck's constant, V_0 a characteristic frequency of the molecule, r the distance between the molecules, and α the polarizability.

Dispersive power — If n_1 and n_2 are the indices of refraction for wave lengths λ_1 and λ_2 and n the mean index or that for sodium light, the dispersive power for the specified wave length is,

$$\omega = \frac{n_2 - n_1}{n - 1}$$

Displacement is a reaction in which an elementary substance displaces and sets free a constituent element from a compound.

Displacement or elongation at any instant. The distance of a vibrating or oscillating particle from its position of equilibrium.

Dissociation-field effect — The increased dissociation (or ionization) of the molecules of weak electrolytes under the influence of high electrical fields (potential gradients).

Distribution law — A substance distributes itself between two immiscible solvents so that the ratio of its concentrations in the two solvents is approximately a constant (and equal to the ratio of the solubilities of the substance in each solvent). The above statement requires modification if more than one molecular species is formed.

Donor — In transistors, the N-type semiconductor, the electrode containing impurities which increase the number of available electrons. Contrast acceptor.

Doppler broadening — The broadening of either an emission line or an absorption line due to random motions of molecules of the gas that is emitting or absorbing the radiant energy. See pressure broadening.

In the case of an emitting gas, for example, those molecules which are approaching the observer as they emit quanta of radiant energy will, because of the Doppler effect, appear to send out a train of waves of slightly shorter wavelength than that characteristic of a stationary molecule, while receding molecules will appear to emit slightly longer wavelengths. The net effect, averaged over many molecules, is to superimpose, on the natural line width, a bell-shaped broadening that is proportional to the square root of the absolute temperature of the gas.

Doppler effect — The change in frequency with which energy reaches a receiver when the receiver and the energy source are in motion relative to each other. Also called Doppler shift.

In the case of sound, or any other wave motion where a real medium of propagation exists (excepting, therefore, light and other electromagnetic radiations) one must distinguish two principal cases: If the source is in motion with speed v relative to a medium which propagates the waves in question at speed c, then the resting observer receives waves emitted with actual frequency f as if they had a frequency f' given by the Doppler equation

$$f' = f/[1 \pm (v/c)]$$

where the positive sign refers to the case of the source receding from the observer, and vice versa for the negative sign. If, on the other hand, the source is at rest relative to the propagating medium while the observer moves with speed v relative to the source,

$$f' = f'[1 \pm (v/c)]$$

where the positive sign now refers to the case of observer approaching the source.

For electromagnetic radition,

$$f/f' = [1 \pm (v/c)]/[1 \pm (v/c)]$$

where the top signs represent the source receding from the observer and the bottom signs, approaching the observer.

Dosimeter — 1. An instrument for measuring the ultraviolet in solar and sky radiation. Compare actinometer. 2. A device, worn by persons working around radioactive material, which indicates the dose of radiation to which they have been exposed.

Double decomposition consists of a simple exchange of the parts of two substances to form two new substances.

Double pass transmittance hologram — A hologram whose object wave was transmitted through the transparent object media to a mirror, reflected back through again, and recorded on the plate.

Dulong and Petit, law of — The specific heats of the several elements are inversely proportional to their atomic weights. The atomic heats of solid elements are constant and approximately equal to 6.3. Certain elements of low atomic weight and high melting point have, however, much lower atomic heats at ordinary temperatures.

Dynamic height — The height of a point in the atmosphere expressed in a unit proportional to the geopotential at that point. Since the geopotential at altitude z is numerically equal to the work done when a particle of unit mass is lifted from sea level up to this height, the dimensions of dynamic height are those of potential energy per unit mass. Also called geodynamic height.

The standard unit of dynamic height H_d is the dynamic meter (or geodynamic meter), defined as $10/\text{sec}^2$; it is related to the geopotential φ, the geometric height z in meters, and the geopotential height Z in geopotential meters by

$$d\varphi = 10dH_d = 9.8dZ = gdz$$

where g is the acceleration of gravity in meters per second squared. (Some sources prefer to give the constants 10 and 9.8 the units of meters per second squared so that the units of φ and Z would be the same as those of the geometric height.) The dynamic meter is about 2% longer than the geometric meter and the geopotential meter. One of the practical advantages of the dynamic height over the geometric height is that when the former is introduced into the hydrostatic equation the variable acceleration of gravity is eliminated. In meteorological height calculations, geopotential height is more often used than dynamic height.

Dynamic pressure (symbol q) = The pressure of a fluid resulting from its motion, equal to one-half the fluid density times the fluid velocity squared $(1/2\varrho V^2)$. In incompressible flow, dynamic pressure is the difference between total pressure and static pressure. Also called kinetic pressure. Compare impact pressure.

Dynamic Viscosity — Of a fluid, the ratio of the shearing stress to the shear of the motion. It is independent of the velocity distribution, the dimensions of the system, etc. and for a gas it is independent of pressure except at very low pressures. Also called coefficient of molecular viscosity, coefficient of viscosity.

For the dynamic viscosity μ of a perfect gas, the kinetic theory of gases gives

$$\mu = 1/3\ (\rho \bar{c} l)$$

where ϱ is the gas density, c is the average speed of the random heat motion of the gas molecules and is proportional to the square root of the temperature, and L is the mean free path. For dry air at 0° C, the dynamic viscosity is about 1.7×10^{-4} g/cm/sec.

Whereas the dynamic viscosity of most gases increases with increasing temperature, that of most liquids, including water, decreases rapidly with increasing temperature.

Dyne — The force necessary to give acceleration of one centimeter per second per second to one gram of mass.

Earth Current — A large-scale surge of electric charge within the earth's crust, associated with a disturbance of the ionosphere.

Current patterns of quasi-circular form and extending over areas the size of whole continents have been identified and are known to be closely related to solar-induced variations in the extreme upper atmosphere.

Eddy current — A current induced in a mass of conducting material by a varying magnetic field. Also called Foucault current.

Eddy viscosity — The turbulent transfer of momentum by eddies giving rise to an internal fluid friction, in a manner analogous to the action of molecular viscosity in laminar flow, but taking place on a much larger scale.

The value of the coefficient of eddy viscosity (an exchange coefficient) is of the order of 10^4 cm²/sec, or 100,000 times the molecular kinematic viscosity.

Effective neutron cycle time — The lifetime of an average neutron within a reactor from the time it is produced to the time it is fission captured.

This average takes into account delayed as well as prompt neutrons.

Effective radius of the earth — A fictitious value for the radius of the earth, used in place of the geometrical radius to correct for atmospheric refraction when the index of refraction in the atmosphere changes linearly with height. See modified index of refraction.

Under conditions of standard refraction the effective radius of the earth is

8.5×10^5 m, or four thirds the geometrical radius. If the effective radius is used in ray tracing diagrams, the rays may be drawn as though they were traveling in straight lines.

Effective terrestrial radiation — The amount by which outgoing infrared terrestrial radiation of the earth's surface exceeds downcoming infrared counterradiation from the atmosphere. Also called nocturnal radiation, effective radiation. See Actinometer.

It is to be emphasized that this amount is a positive quantity, of the order of several tenths of a langley per minute, at all times of day (except under conditions of low overcast clouds). It typically attains its diurnal maximum during the midday hours when high soil temperatures create high rates of outgoing terrestrial radiation. (For this reason the synonym nocturnal radiation is apt to lead to slight confusion.) However, in daylight hours the effective terrestrial radiation is generally much smaller than the insolation, while at night it typically dominates the energy budget of the earth's surface.

Einstein theory for mass-energy equivalence — The equivalence of a quantity of mass m and a quantity of energy E by the formula $E = mc^2$. The conversion factor c^2 is the square of the velocity of light.

Elastic collision — A collision between two particles in which no change occurs in the internal energy of the particles, or in the sum of their kinetic energies. Commonly referred to as a billiard-ball collision.

Elasticity — The property by virtue of which a body resists and recovers from deformation produced by force.

Elastic limit — The smallest value of the stress producing permanent alteration.

Elastic moduli —

Young's modulus by stretching — If an elongation s is produced by the weight of the mass m, in a wire of length l, and radius r, the modulus,

$$M = \frac{mgl}{\pi r^2 s}$$

Young's modulus by bending, bar supported at both ends. If a flexure s is produced by the weight of mass m, added midway between the supports spearated by a distance l for a rectangular bar with vertical dimensions of cross-section a and horizontal dimension b, the modulus is,

$$M = \frac{mgl^3}{4sa^3 b}$$

For a cylindrical bar of radius r,

$$M = \frac{mgl^3}{12\pi r^4 s}$$

For a bar supported at one end. In the case of a rectangular bar as described above,

$$M = \frac{4mgl^3}{sa^3 b}$$

For a round bar supported at one end,

$$M = \frac{4mgl^3}{3\pi r^4 s}$$

Modulus of rigidity — If a couple C (= mgx) produces a twist of θ radians in a bar of length l and radius r, the modulus is

$$M = \frac{2Cl}{\pi r^4 \theta}$$

The substitution in the above formulae for the elastic coefficients of m in grams, g in cm/sec², l, a, b, and r in cm, s in cm, and C in dyne-cm will give moduli in dyn/cm². The dimensions of elastic moduli are the same as of stress, $[ml^{-1} t^{-2}]$.

Coefficient of restitution — Two bodies moving in the same straight line, with velocities v_1 and v_2 respectively, collide and after impact move with velocities v_3 and v_4. The coefficient of restitution is

$$C = \frac{v_4 - v_3}{v_2 - v_1}$$

Electret n — A piece of dielectric material that has a permanent electric polarity; the electrostatic analog of a permanent magnet.

Electric dipole — A pair of equal and opposite charges an infinitesimal distance apart.

Electric field intensity is measured by the force exerted on unit charge. Unit field intensity is the field which exerts the force of one dyne on unit positive charge. Dimensions, $[\varepsilon^{-1/2} m^{1/2} l^{-1/2} t^{-1}]$; . $[\mu^{1/2} m^{1/2} l^{1/2} t^{-2}]$.

The field intensity or force exerted on unit charge at a point distant r from a charge q in a vacuum

$$H = \frac{q}{r^2}$$

If the dielectric in the above cases is not a vacuum the dielectric constant ε must be introduced. The formula becomes

$$H = \frac{q}{\varepsilon r^2}$$

The value of ε is frequently considered unity for air. If the dielectric constant of a vacuum is considered unity the value for air at 0°C and 760 mm pressure is 1.000576.

Electric potential — The work per unit charge spent in moving a charged body in an electric field from a reference point to a point of interest (P). Commonly, the reference point is chosen as infinity. The potential (V) is positive if work is done on the charge and negative if work is required of the charge to move in the existing field. Analytically, assuming an electric field of intensity E,

$$V = \int_{\infty}^{P} E \cdot ds$$

where ds is a vector element of the path from ∞ to P.

Electrochemical equivalent of an ion is the mass liberated by the passage of unit quantity of electricity.

Electrolysis — If a current i flows for a time t and deposits a metal whose electrochemical equivalent is e, the mass deposited is

$$m = eit$$

The value of e is usually given for mass in grams, i in amperes and t in seconds.

Electrolytic cell constant, J_e — The cell constant of an electrolytic cell is the resistance in ohms of that cell when filled with a liquid of unit resistance.

Electrolytic dissociation or ionization theory — When an acid, base or salt is dissolved in water or any other dissociating solvent, a part or all of the molecules of the dissolved substance are broken up into parts called ions, some of which are charged with positive electricity and are called cations, and an equivalent number of whch are charged with negative electricity and are called anions.

Electrolytic solution tension theory (or the Helmholtz double layer theory) — When a metal, or any other substance capable of existing in solution as ions, is placed in water or any other dissociating solvent, a part of the metal or other substances passes into solution in the form of ions, thus leaving the remainder of the metal or substances charged with an equivalent amount of electricity of opposite sign from that carried by the ions. This establishes a difference in potential between the metal and the solvent in which it is immersed.

Electromagnetic radiation — Energy, propagated through space or through material media in the form of an advancing disturbance in electric and magnetic fields existing in space or in the media. The term radiation, alone, is used commonly for this type of energy, although it actually has a broader meaning. Also called electromagnetic energy or simply radiation. See Electromagnetic spctrum.

Electromagnetic spectrum — The ordered array of known electromagnetic radiations, extending from the shortest cosmic rays, through gamma rays, X-rays, ultraviolet radiation, visible radiation, infrared radiation, and including microwave and all other wavelengths of radio energy See Ebsorption spectrum.

The division of this continuum of wavelengths (or frequencies) into a number of named subportions is rather arbitrary and, with one or two exceptions, the boundaries of the several subportions are only vaguely defined. Nevertheless, to each of the commonly identified subportions there correspond characteristic types of physical systems capable of emitting radiation of those wavelengths. Thus, gamma rays are emitted from the nuclei of atoms as they undergo any of several types of nuclear rearrangements; visible light is emitted, for the most part, by atoms whose planetary electrons are undergoing transitions to lower energy states; infrared radiations are associated with characteristic molecular vibrations and rotations; and radio waves, broadly speaking, are emitted by virtue of the accelerations of free electrons as, for example, the moving electrons in a radio antenna wire.

Electromotive force is defined as that which causes a flow of current. The electromotive force of a cell is measured by the maximum difference of potential between its plates. The electromagnetic unit of potential difference is that against which one erg of work is done in the transfer of electromagnetic unit quantity. The volt is that potential difference against which one joule of work is done in the transfer of one coulomb. One volt is equivalent to .0^8 electromagnetic units of potential. The international volt is the electrical potential which when steadily applied to a conductor whose resistance is one international ohm will cause a current of one international ampere to flow. The international volt = 1.00033 absolute volts. The electromotive force of a Weston standard cell is 1.0183 int. volts at 20°C. Dimensions, $[\epsilon^{-1/2}\, m^{1/2}\, t^{-1}]$, $[\mu^{1/2}\, m^{1/2}\, l^{3/2}\, t^{-2}]$.

Electromotive series is a list of the metals arranged in the decreasing order of their tendencies to pass into ionic form by losing electrons.

Electron — The electron is a small particle having a unit negative electrical charge, a small mass, and a small diameter. Its charge is $(4.80294 \pm 0.00008) \times 10^{-10}$ absolute electrostatic units, its mass. $^{1}{}_{1837}$ that of the hydrogen nucleus, and its diameter about 10^{-12} cm. The electron has a rest mass of 0.9109534 10^{-30}kg and a magnetic moment of 9.284832×10^{-24}J T^{-1}. Every atom consists of one nucleus and one or more electrons. Cathode rays and Beta rays are electons.

Elecron-volt (ev) — Energy acquired by any charged particle carrying unit electronic charge when it falls through a potential difference of one volt. 1 electron-volt = $(1.60207 \pm 0.00007 \times 10^{-12}$ erg or 1.6020×10^{-9} joule. Multiples of this unit are also in common use: the kilo-, million-, and billion electron-volt. 1 kev = 10^3ev; 1 mev = 10^6ev; and 1 bev = 10^9 ev.

An ev is associated through the Planck constant with a photon of wave length 1.2395 μm.

Electrophoretic effect — The slowing down owing to interionic attraction and repulsion, of the movement of an ion with its solvent molecules in the forward direction by ions of opposite charge with their solvent molecules moving in the reverse direction under an applied electrical field (potential gradient).

Electrostatic unit — 1. In the cgs system the measure of electrostatic charge, defined as a charge which, if concentrated at one point in a vacuum, would repel, with a force of 1 dyn, an equal and like charge placed 1 cm away. 2. (pl.) A system of electrical units based on the electrostatic unit.

Elements are substances which cannot be decomposed by the ordinary types of chemical change, or made by chemical union.

Elliptical polarization — The polarization of a wave radiated by an electric vector rotating in a plane and simultaneously varying in amplitude so as to describe an ellipse.

Elongation — In tensile testing the elongation of a specimen is the increase in gage length, after rupture, referred to the original gage length. It is reported as percentage elongation.

Emission spectrum — The array of wavelengths and relative intensities of electromagnetic radiation emitted by a given radiator.

Each radiating substance has a unique, characteristic emission spectrum, just as every medium of transmission has its individual absorption spectrum.

Emissive power or emissivity is measured by the energy radiated from unit area of a surface in unit time for unit difference of temperature between the surface in question and surrounding bodies. For the cgs system the emissive power is given in ergs per second per square centimeter with the radiating surface at 1° absolute and the surroundings at absolute zero. See Radiation formula.

Emissivity (symbol E∞) — A property of a material, measured as the emittance of a specimen of the material that is thick enough to be completely opaque and has an optically smooth surface.

Emittance (symbol E, ε) — 1. The radiant flux per unit area emitted by a body. 2. The ratio of the emitted radiant flux per unit area of a sample to that of a black body radiator at the same temperature and under the same conditions.

Spectral emittance refers to emittance measured at a specified wavelength.

Because of the two common meanings of emittance, it should be defined when used unless the context allows no misinterpretation.

Emulsion — The coating on a film or plate which is sensitive to the light illuminating it.

Enantiotropic — Crystal capable of existing in reversible equilibrium with each other.

Energy — The capability of doing work. Potential energy is energy due to position of one body with respect to another or to the relative parts of the same body. Kinetic energy is energy due to motion. Cgs units, the erg, the energy expended when a force of 1 dyn acts through a distance of 1 cm; the joule is 1 × 10^7 ergs. Dimensions, $[ml^2\, t^{-2}]$.

The potential energy of a mass m, raised through a distance h, where g is the acceleration due to gravity is

$$E = mgh.$$

The kinetic energy of mass m, moving with a velocity v, is

$$E = \tfrac{1}{2}mv^2$$

Energy will be given in ergs if m is in grams, g in centimeters per second square, h in centimeters and v in centimeters per second.

Energy of a charge in ergs where Q is the charge and V the potential in electrostatic units.

$$E = \tfrac{1}{2}QV$$

Energy of the electric field — If H is the electric field intensity in electrostatic units and K the specific inductive capacity, the energy of the field in ergs per cm^3 is

$$E = \frac{KH^2}{8\pi}$$

Energy of rotation — If a mass whose moment of inertia about an axis is I, rotates with angular velocity ω about this axis, the kinetic energy of rotation will be,

$$E = \tfrac{1}{2}I\omega^2$$

Energy will be given in ergs if I is in g-cm^2 and ω in radians per second.

Enthalpy, or heat content, is a thermodynamic quantity. It is equal to the sum of the internal energy of a system plus the product of the pressure-volume work done on the system. Thus

$$H = E + pv$$

where

H = enthalpy or heat content
E = internal energy of the system
p = pressure
v = volume.

Entropy — 1. A measure of the extent to which the energy of a system is unavailable. A mathematically defined thermodynamic function of state, the increase in which gives a measure of the energy of a system which has ceased to be available for work during a certain process

$$ds = (du + pdv)/T \geqslant dq/T$$

where s is specific entropy; us is specific internal energy; p is pressure; v is specific volume; T is Kelvin temperature; and q is heat per unit mass. For reversible processes,

$$ds = dq/T$$

In terms of potential temperature 0,

$$ds = c_p\,(d\theta/\theta)$$

where cp is the specific heat at constant pressure. See third law of thermodynamics.

In an adiabatic process, the entropy increases if the process is irreversible and remains unchanged if the process is reversible. Thus, since all natural processes are irreversible. and remains unchanged if the process is reversible. Thus, since all natural processes are irreversible, it is said that in an isolated system the entropy is always increasing as the system tends toward equilibrium, a statement which may be considered a form of the second law of thermodynamics.

2. In communication theory, average information content.

Ephemeris day — 86,400 ephemeris seconds. See Ephemeris time.

Ephemeris second (unit of time) — is exactly 1/31 556 925.974 7 of the tropical year of 1900, January, 0 days, and 12 hr ephemeris time.

Ephemeris time (abbr. E.T.) — The uniform measure of time defined by the laws of dynamics and determined in principle from the orbital motions of the planets, specifically the orbital motion of the earth as represented by Newcomb's Tables of the Sun. Compare universal time.

Beginning with the volume for 1960 the American Ephemeris and Nautical Almanac uses ephemeris time as the tabular argument in the fundamental ephemerides of the sun, moon, and planets.

A gravitational ephemeris expresses the position of a celestial body as a function of ephemeris time; and, at any instant, the measure of ephemeris time is the value of the argument at which the ephemeris position is the same as the actual position at the instant. The ephemeris time at any instant is obtained from observation by directly comparing observed position of the sun, moon, and planets with graviatational ephemerides of their coordinates; observations of the moon are the most effective and expeditious for this purpose. An accurate determination, however, requires observations over a more or less extended period; in practice, it takes the form of determining the time correction ΔT that must be applied to universal time (U.T.) to obtain ephemeris time:

$$\text{E.T.} = \text{U.T.} + \Delta T$$

The universal time at any instant may be obtained with little delay from observations of the diurnal motions.

The fundamental epoch from which ephemeris time is reckoned is the epoch that Newcomb designated as 1900 January 0, Greenwich mean noon, but which actually is 1900 January 0 day 12 hr E.T.; the instant to which this designation is assigned is the instant near the beginning of the calendar year A.D. 1900 when the geometric mean longitude of the Sun referred to the mean equinox of date was 279 degrees 41 minutes 48.04 seconds. Ephemeris time is the measure of time in which Newcomb's Tables of the Sun agree with observation.

The primary unit of ephemeris time is the tropical year, defined by the mean motion of the sun in longitude at the epoch 1900 January 0 day 12 hr E.T.; its length in ephemeris days is determined by the coefficient of T in Newcomb's expression for the geometric mean longitude of the sun L referred to the mean equinox of date, given among the elements of the sun.

Equatorial system — A set of celestial coordinates based on the celestial equator as the primary great circle; usually declination and hour angle or sidereal hour angle. Also called equinoctial system of coordinates, celestial equato system of coordinates.

Equilibrium, chemical — A state of affairs in which a chemical reaction and its reverse reaction are taking place at equal velocities, so that the concentrations of reacting substances remain constant.

Equilibrium constant — The product of the concentrations (or activities) of the substances produced at equilibrium in a chemical reaction divided by the product of concentrations of the reacting substances, each concentration raised to that power which is the coefficient of the substance in the chemical equation.

Equivalent conductance of an electrolyte is defined as the conductance of a volume of solution containing one equivalent weight of dissolved substance when placed between two parallel electrodes 1 em apart, and large enough to contain between them all of the solution. ‘ is never determined directly, but is calculated from the specific conductance. If C is the concentration of a solution in gram equivalents per liter, then the concentration per cubic centimeter is C/1000, and the volume containing one equivalent of the solute is; therefore, 1000/C. Since L_s is the conductance of a centimeter cube of the solution, the conductance of 1000/C cc, and hence ‘ will be

$$\Delta = \frac{1000L_s}{C}$$

Equivalent temperature — 1. Isobaric equivalent temperature; the temperature that an air parcel would have if all water vapor were condensed out at constant pressure, the latent heat released being used to heat the air,

$$T_{i,e} = T[1 + (Lw/c_pT)]$$

where $T_{i,e}$ is the isobaric equivalent temperature; T is the temperature; w is the mixing ratio; L is the latent heat: and c_p is the specific heat of air at constant pressure. 2. Adiabatic equivalent temperature; The temperature that an air parcel would have after undergoing the following (physically unrealizable) process: dry-adiabatic expansion until saturated; pseudoadiabatic expansion until all moisture is precipitated out; dry-adiabatic expansion until saturated; pseudoadiabatic expansion until saturated; pseudoadiabatic expansion until all moisture is precipitated out; dry-adiabatic compression to the initial pressure. This is the equivalent temperature as read from a thermodynamic chart and is always greater than the isobaric equivalent temperature:

$$T_{a,e} = T \exp (Lw/c_pT)$$

where $T_{a,e}$ is the adiabatic equivalent temperature. Also called pseudoequivalent temperature.

Equivalent weight or combining weight of an element or ion is its atomic or formula weight divided by its valence. Elements entering into combination always do so in quantities proportional to their equivalent weights.

In oxidation-reduction reactions the equivalent weight of the reacting substances is dependent upon the change in oxidation number of the particular substance.

erg — The unit of energy or work in the centimeter-gram-second system; the work performed by a force of 1 dyn acting through a distance of 1 cm.

Escape velocity — The radial speed which a particle or larger body must attain in order to escape from the gravitational field of a planet or star. When friction is neglected, the escape velocity is

$$\sqrt{2Gm/r}$$

where G is the universal gravitational constant m is the mass of the planet or star; and r is the radial distance from the center of the planet or star. Also called escape speed.

Ettinghausen's effect (Von Ettinghausen's) — When an electric current flows across the lines of force of a magnetic field an electromotive force is observed which is at right angles to both the primary current and the magnetic field: a temperature gradient is observed which has the opposite direction to the Hall electromotive force.

Eutectic — A term applied to the mixture of two or more substances which has the lowest melting point.

Exchange coefficients — Coefficients of eddy flux (e.g., of momentum, heat, water vapor, etc) in turbulent flow, defined in analogy to those of the kinetic theory of gases (see eddy). Also called austausch coefficients, eddy coefficients, interchange coefficients.

The exchange-coefficient hypothesis states that the mean eddy flux per unit area of a conservative quantity (suitably expressed) is proportional to the gradient of the mean value of this quantity, that is,

$$\text{Mean flux per unit area} = -C_e\,(d\bar{E}/dN)$$

where G_e is the exchange coefficient; E is the mean value of the quantity; and N is the direction normal to the surface. In strict analogy to molecular properties C_e would be constant, for turbulent flow C_e turns out to depend on time and location. See eddy viscosity diffusivity.

Expansion of gases — *Charles' law or Gay-Lussac's law* — The volume of a gas at constant pressure increases proportionately to the absolute temperature. If V_1 and V_2 are volumes of the same mass of gas at absolute temperatures, T_1 and T_2,

$$\frac{V_1}{V_2} = \frac{T_1}{T_2}$$

For an original volume V_o at 0°C the volume at t° C (at constant pressure) is

$$V_t = V_o\ (1 + 0.00367t).$$

General law for gases —

$$p_t v_t = p_0 v_0 \left(1 + \frac{t}{273}\right)$$

where p_0, v_0, p_t, v_t represent the pressure and volume at 0° and t°C or

$$\frac{p_1 v_1}{T_1} = \frac{p_2 v_2}{T_2}$$

where p_1, v_1 and T_1 represent pressure, volume and absolute temperature in one case and p_2, v_2 and T_2 the same quantities for the same mass of gas in another.

The law may also be expressed:

$$pv = RmT$$

where m is the mass of gas at absolute temperature T. R is the gas constant which depends on the units used. Boltzmann's molecular gas constant is obtained by expressing m in terms of the number of molecules.

For volume in cm³, pressure in dynes per cm² and temperature in Centigrade degrees on the absolute scale $R = 8.3136 \times 10^7$.

Reduction of a gas volume to 0°C, 760 mm pressure: — If V is the original volume at 0°C and 760 mm pressure will be,

$$V_0 = \frac{V}{(1 + \alpha t)} \frac{H}{760}$$

If d is the original density the density at 0°C and 760 mm pressure will be

$$d_0 = d(1 + \alpha t) \frac{760}{H}$$

$$\alpha = 0.00367 \text{ approximately.}$$

Extinction coefficient — The extinction coefficient ϵ is identified as

$$dI = -\epsilon I \, dx$$

or

$$I = I_0 e^{-\epsilon x}$$

where I is the illuminance (luminous flux density) at the selected point in space, I_0 is the illuminance at the light source, and x is the distance from the source.

When so used, the extinction coefficient equals the sum of the medium's absorption coefficient and scattering coefficient, each computed as a weighted average over all wavelengths in the visible spectrum. As long as scattering effects are primary, a in the lower atmosphere, the value of the extinction coefficient is a function of the particle size of atmospheric suspensoids. It varies in order of magnitude from 10/km with very low visibility to 0.01/km in very clear air.

Extinction cross section = scattering cross section.

Extraterrestrial radiation — In general, solar radiation received just outside the earth's atmosphere.

Fahrenheit temperature scale (abbr. F) — A temperature scale with the ice point at 32° and the boiling point of water at 212°.

Conversion with the Celsius (centrigrade) temperature scale (abbr. C) is by the formula

$$F = 9/5\,C + 32$$

Falling bodies — For bodies falling from rest conditions are as for uniformly accelerated motion except that $v_o = O$ and g is the acceleration due to gravity. The formulae become, air resistance neglected,

$$v_t = gt, \; s = \tfrac{1}{2}gt^2 \;\; v_3 = \sqrt{2gs}.$$

For bodies projected vertically upward, if v is the velocity in projection, the time to reach greatest height, neglecting the resistance of the air,

$$t = \frac{v}{g}$$

Greatest height,

$$h = \frac{v^2}{2g}$$

See Projectiles.

Farad (unit of electric capacitance) — the capacitance of a capacitor between the plates of which there appears a difference of potential of 1 when it is charged by a quantity of electricity equal to 1 coulomb.

Faraday, determination of (1960) By the National Bureau of Standards which uses an electrochemical method that dissolves, rather than deposits, silver from a solution. The new value, 96,516 ± 2 coulombs (physical scale) or 96,489 ± 2 coulombs (chemical scale). NBS used its mass, time, and elecrical standards in measuring the faraday, and have found that its value agreed within 22 ppm. with the one obtained by an independent physical method using the omegration.

Faraday constant (symbol F) — The product of the Avogadro constant N_A and the elementary charge e, $F = N_A e = 96{,}489 \pm 2$ coulombs/mol.

Faraday effect — The rotation of the plane of polarization produced when plane-polarized light is passed through a substance in a magnetic field, the light traveling in a direction parallel to the lines of force. For a given substance, the rotation is proportional to the thickness traversed by the light and to the magnetic field strength.

Faraday's laws — In the process of electrolytic changes equal quantities of electricity charge or discharge equivalent quantities of ions at each electrode.

One gram equivalent weight of matter is chemically altered at each electrode for 96,489 int. coulombs, or one faraday, of electricity passed through the electrolyte.

Far field (diffraction pattern) — Diffraction pattern produced at a large range from an object which is identical to that which would be produced at an infinite range from the object. This is also called a Fraunhofer diffraction pattern.

Fast neutron — A neutron of 100,000 electron-volts or greater energy.

Fast reactor — A reactor containing no moderator, so that all the fissions take place at energies on the order of 100,000 electron-volts or higher.

Femto — A prefix meaning one quadrillionth or 10^{-15}. Symbol is f.

Fermat's principle — The path followed by light (or other waves) passing through any collection of media from one specified point to another, is that path for which the time of travel is least.

Fermi (abbr. f) — A unit of length equal to 10^{-13} cm.

Ferrimagnetic Materials — Those in which the magnetic moments of atoms or ions tend to assume an ordered but nonparallel arrangement in zero applied field, below a characteristic temperature called the Néel Point. In the usual case, within a magnetic domain, a substantial net magnetization results from the antiparallel alignment of neighboring nonequivalent sublattices. The macroscopic behavior is similar to that in ferromagnetism. Above the Neel Point, these materials become paramagnetic.

Ferrogmatic Materials — Those in which the magnetic moments of atoms or ions in a magnetic domain tend to be aligned parallel to one another in zero applied field, below a characteristic temperature called the Curie Point. Complete ordering is achieved only at the absolute zero of temperature. Within a magnetic domain, at absolute zero, the magnetization is equal to the sum of the magnetic moments of the atoms or ions per unit volume. Bulk matter, consisting of many small magnetic domains, has a net magnetization which depends upon the magnetic history of the specimen (hysteresis effect). The permeability depends on the magnetic field, and can reach values of the order of 10^6 times that of free space. Above the Currie Point, these materials become paramagnetic.

First law of thermodynamics — A statement of the conservtion of energy for thermodynamic systems (not necessarily in equilibrium). The fundamental form requires that the heat absorbed by the system serve either to raise the internal energy of the system or to do work on the environment:

$$dq = du + dw$$

where dq is the heat added per unit mass; du is the increment of specific internal energy; and dw is the specific work done by the system on the environment. Although dq and dw are not perfect differentials, their difference, dv, is always a perfect differential. Example of the application of this equation: in an adiabatic free expansion of gas into a vacuum, all three terms are zero.

For reversible processes the mechanical work is equal to the expansion against the pressure forces, i.e.,

$$dw = pdv$$

where p is the pressure and v is the specific volume. For a perfect gas, the internal energy change is proportional to the temperature change,

$$du = c_v dT$$

where c_v is the specific heat at constant volume and T is the Kelvin temperature. Therefore, the form of the first law usually used in meteorological applications is

$$dq = c_v dT + pdv$$

Use of the equation of state yields an alternative form,

$$dq = c_p dT - dp$$

where c_p is the specific heat at constant pressure.

For open systems the variation of total rather than specific quantities is important:

$$dQ = dU + pdV - hdm$$

where Q is the total heat; U is the total internal energy; V is the volume; m is the mass of the system; and h is the specific enthalpy.

If a system contains the possibility of nonmechanical work, such as work done against an electric field, this work must be included in the first law.

See Second law of thermodynamics, Third law of thermodynamics, Energy equations.

Fission — The splitting of an atomic nucleus into two more-or-less equal fragments.

Fission may occur spontaneously or may be induced by capture of bombarding particles. In addition to the fission fragments, neutrons and gamma rays are usually produced during fission.

Fleming's rule — A simple rule for relating the directions of the flux, motion, and e.m.f. in an electric machine. The forefinger, second finger and thumb, placed at right-angles to each other, represent respectively the directions of flux, e.m.f., and motion or torque. If the right hand is used the conditions are those obtaining in a generator and if the left hand is used the conditions are those obtaining in a motor.

Fluidity — The reciprocal of viscosity. The cgs unit is the rhe, the reciprocal of the poise. Dimensions, [m^{-1} lt].

Fluorescence — The property of emitting radiation as the result of absorption of radiation from some other source. The emitted radiation persists only as long as the exposure is subjected to radiation which may be either electrified particles or waves. The fluorescent radiation generally has a longer wave length than that of the absorbed radiation. If the fluorescent radiation includes waves of the same length as that of the absorbed radiation it is termed resonance radiation.

f/n or f number (of optics) — The ratio of effective focal length to lens diameter.

Focal length — The distance between the optical center of a lens, or the surface of a mirror, and its focus.

Focal plane — A plane parallel to the plane of a lens or mirror and passing through the focus.

Focal point = focus, in optics.

Focus (plural focuses) — 1. That point at which parallel rays of light meet after being refracted by a lens or reflected by a mirror. Also called focal point. 2. A point having specific significance relative to a geometrical figure. See Ellipse, Hyperbola, Parabola.

Footcandle (abbr. fc) — A unit of illuminance, incident light, or illumination equal to 1 lm/ft^2. This is the illuminance provided by a light source of one candle at a distance of 1 ft, hence the name. Compare lux, phot.

Full sunlight with zenith sun produces an illuminance of the order of 10,000 footcandles on a horizontal surface at the earth's surface. Full moonlight provides an illuminance of only about 0.02 footcandle also at earth's surface. Adequate illumination for steady reading is taken to be about 10 footcandles; that for close machine work is about 30 to 40 footcandles.

Foot-lambert (abbr.ft-l) — A unit of luminance (or brightness) equal to $1/\pi$ candle per square foot, or 1 lm/ ft^2.

In Great Britain this is also called the equivalent footcandle.

Force — That which changes the state of rest or motion in matter, measured by the rate of change of momentum. Absolute unit, the dyne, the force which will produce an acceleration of one centimeter per second per second in a gram mass. The gram weight or weight of a gram mass is the cgs gravitational unit. The poundal is that force which will give an acceleration of one foot per second per second to a pound mass. Dimensions, [mlt^{-2}].

The force F required to produce an acceleration a in a mass m is given by

$$F = ma$$

If m is substituted in grams and a in cm per sec^2, F will be given in dynes.

Force between two charges, Coulomb's law — If two charges q and q′ are at a distance r in a vacuum, the force between them is,

$$F = \frac{qq'}{r^2}$$

The force will be given in dynes if q and q′ are in electrostatic units and r in centimeters.

Force between two magnetic poles — If two poles of strength m and m′ are separated by a distance r in a medium whose permeability is μ (unity for a vacuum), the force between them is,

$$F = \frac{mm'}{\mu r^2}$$

Force will be given in dynes if r is in cm and m and m′ are in cgs units of pole strength.

The strength of a magnetic field at a point distance r from an isolated pole of strength m is

$$H = \frac{m}{\mu r^2}$$

The field will be given in gauss if m and r are in cgs units.

Formula, chemical — A combination of symbols with their subscripts representing the constituents of a substance and their proportions by weight.

Fourier transform plane — Same as spatial frequency plane.

Fraunhofer's lines — When sunlight is examined through a spectroscope it is found that the spectrum is traversed by an enormous number of dark lines parallel to the length of the slit. These dark lines are known as Fraunhofer's lines. Kirchoff conceived the idea that the sun is surrounded by layers of vapors which act as filters of the white light arising from incandescent solids within and which abstract those rays which correspond in their periods of vibration to those of the components of the vapors. Thus reversed or dark lines are obtained due to the absorption by the vapor envelop, in place of the bright lines found in the emission spectrum.

Frequency — Rate of oscillation; units: 1 cycle sec^{-1} = 1 Hertz = 1 Hz. 1 megacycle = 1 megahertz = 10^6 Hz. One gigahertz = 10^9 Hz.

Frequency modulation — A form of angle modulation in which the frequency of the carrier is made to vary in accordance with the information to be transmitted, that is, given a carrier

$$C(t) = A\cos(\omega_0 t + \phi),$$

and an information function g(t), the signal transmitted is

$$C_m(t) = A\cos[(\omega_0 + g(t) - \Delta\omega)(t) + \phi].$$

When used for radio communications this system has the advantages of greater immunity from noise and other interference, at the cost of increased bandwidth.

Frequency of vibrating strings — The fundamental frequency of a stretched string is given by

$$n = \frac{1}{2l}\sqrt{\frac{T}{m}}$$

where l is the length, T, the tension and m the mass per unit length.

For a string or wire of circular section of length l, tension T, density d, and radius r, the frequency of the fundamental is

$$n = \frac{1}{2rl}\sqrt{\frac{T}{\pi d}}$$

The frequency in vibrations per second will be given if T is in dynes, r and l in cm and d in g per cm³.

Frequency (of waves) — Number of like phase (peaks, troughs) wavefronts passing a given point in a unit of time.

Frequency standard (atomic or molecular frequency standard) — The standard is the transition between the hyperfine levels F = 4, M = 0 and F = 3, M = 0 of the ground state $^2S_{1/2}$ of the cesium-133 atom, unperturbed by external fields. This frequency of transition is assigned the value 9 192 631 770 hertz.

Fresnel — A measure of frequency, defined as equal to 10^{12} cycles/sec.

Friction, coefficient of — The coefficient of friction between two surfaces is the ratio of the force required to move one over the other to the total force pressing the two together.

If F is the force required to move one surface over another and W, the force pressing the surfaces together, the coefficient of friction,

$$k = \frac{F}{W}$$

Fringe — The locus of maximum constructive interference (light fringe) or destructive interference regions in a space where two or more coherent waves intersect. Fringes can be in two or three dimensions.

Fringe control — Methods of adjusting the position and/or characteristics of the fringe pattern of a holographic interferogram.

Fugacity (symbol f) — In thermodynamics, a measure of the tendency of a substance to escape by some chemical process from the phase in which it exists.

Fundamental units — See Mass, Length, and Time.

Fusion (atomic) — A nuclear reaction involving the combination of smaller atomic nuclei or particles into larger ones with the release of energy from mass transformation. This is also called a thermo-nuclear reaction by reason of the extremely high temperature required to initiate it.

Gal — 1 gal = cm/sec/sec. Therefore, where the value of gravity is 980 this is the same as 980 gal. The milligal is now quite commonly used since it is approximately one part in a thousand of the normal gravity of the earth.

Gamma (γ) rays (nuclear X-rays) — May be emitted from radioactive substances. They are quanta of electromagnetic wave energy similar to but of much higher energy than ordinary X-rays. The energy of a quantum is equal to hv ergs, where h is Planck's constant (6.6254×10^{-27} erg sec) and v is the frequency of the radiation. Gamma rays are highly penetrating, an appreciable fraction being able to traverse several centimeters of lead.

Gas — A state of matter in which the molecules are practically unrestricted by cohesive forces. A gas has neither definite shape nor volume.

Gas constant (symbol R, R^*, R_0) — The constant factor in the equation of state for perfect gases. The universal gas constant is

$$R_0 = 8.3143 \text{ joules/}^\circ\text{K-mol}$$

The gas constant for a particular gas, specific gas constant,

$$r = R/m$$

where m is the molecular weight of the gas. See Boltzmann constant.

Gas thermometer — where Pi0, P_s and P_x represent the total pressure with the bulb at 0°C, at the boiling-point of water and at the unknown temperature respectively, t_s the temperature of steam and t_x the unknown temperature,

$$t_x = t_s \frac{P_x - P_0}{P_s - P_0}$$

(approximately). The total pressure on the gas in the bulb is the algebraic sum of barometric pressure at the time and that measured by the manometer.

Gauss — The cgs emu of magnetic induction (flux density). It is equal to 1 maxwell per cm². It has such a value that magnetic field at a velocity of 1 cm, in an induction mutually perpendicular, the induced emf is one abvolt.

Gay-Lussac's law — See Charles' law.

Gay-Lussac's law of combining volumes — If gases interact and form a gaseous product, the volumes of the reacting gases and the volumes of the gaseous products are to each other in simple proportions, which can be expressed by small whole numbers.

Gee — A suffix meaning earth, as in perigee, apogee. See Perigee, note.

Geiger counter — Detector for radioactivity depending upon ionized particles that affect its mechanism. As its name indicates, it both detects and makes a count of them possible.

Geomagnetic pole — Either of two antipodal points marking the intersection of the earth's surface with the extended axis of a dipole assumed to be located at the center of the earth and approximating the source of the actual magnetic field of the earth.

That pole in the Northern Hemisphere (latitude, 78½° N; longitude, 69° W) is designated north geomagnetic pole, and that pole in the Southern Hemisphere (latitude, 78½° S, longitude, 111°E) is designated south geomagnetic pole. The great circle midway between these poles is called geomagnetic equator. The expression geomagnetic pole should not be confused with magnetic pole, which relates to the actual magnetic field of the earth.

Geometric mean — A measure of central position. The geometric mean of n quantities equals the nth root of the product of the quantities.

Geopotential — The geopotential Φ of a point at a height z above mean sea level is the work which must be accomplished against gravity in elevating a unit mass from sea level to height z.

$$\Phi = \int_0^z g\,dz$$

where g is the local acceleration of gravity at height z. For most metrological work geopotential is given in the units geopotential meter (gpm). By definition, 1 gpm = 9.8×10^4 cm² sec⁻². For most purposes the geopotential can be assumed to equal the geometric height.

Geopotential height — The height of a given point in the atmosphere in units proportional to the potential energy of unit mass (geopotential) at this height, relative to sea level.

The relation, in the cgs system, between the geopotential height H and the geometric height Z is

$$H = \frac{1}{980}\int_0^Z g\,dZ$$

where g is the acceleration of gravity, so that the two heights are numerically interchangeable for most meteorological purposes. Also, 1 geopotential meter is equal to 0.98 dynamic meter. See dynamic height.

At the present time, the geopotential height unit is used for all aerological reports, by convention of the World Meteorological Organization.

Geopotential meter — A unit of length used in measuring geopotential height; 1 geopotential meter is equal to 0.98 dynamic meter. See Dynamic height.

Gibbs free energy = Gibbs function.

Gibbs function — a mathematically defined thermodynamic function of state, which is constant during a reversible isobaric-isothermal process. Also called Gibbs free energy, thermodynamic potential. Compare Helmholtz function.

In symbols the specific Gibbs function g is

$$g = h - Ts$$

where h is specific enthalpy; T is Kelvin temperature; and s is specific entropy. By use of the first law of thermodynamics for reversible processes,

$$dg = -s\,dT + dp$$

Gibbs' phase rule — F = C + 2 − P, F, the number of degrees of freedom of a system, is the number of variable factors (temperature, pressure and concentration) of the components, which must be arbitrarily fixed in order that the condition of the system m ay be perfectly defined. C, the number of the components of the system, is chosen equal to the smallest number of independently variable constituents by means of which the composition of each phase participating in the state of equilibrium can be expressed in the form of a chemical equation; the components must be chosen from among the constituents which are present when the system is in a state of true equilibrium and which take part in that equilibrium; as components are chosen the smallest number of such constituents necessary to express the composition of each phase participating in the equilibrium, zero and negative quantities of components being permissible; in any system the number of components is definite, but may alter with changes in conditions of experiment; a qualitative but not quantitative freedom of selection of components is allowed, the choice being influenced by suitability and simplicity of application. P, the number of phases of the system, are the homogeneous, mechanically separable and physically distinct portions of a heterogeneous system; the number of phases capable of existence varies greatly in different systems; there can never be more than one gas or vapor phase since all gases are miscible in all proportions, a heterogeneous mixture of solid substances forms as many phases as there are substances present.

Giga — A prefix meaning billion or 10^9. Symbol is G.

Gilbert (abbr. Gb) — The cgs emu of magnetomotive force. 1 Gb = $10/4\pi$ ampere-turns.

Global radiation — The total of direct solar radiation and diffuse sky radiation received by a unit horizontal surface.

Graham's law — The relative rates of diffusion of gases under the same conditions are inversely proportional to the square roots of the densities of those gases.

Gram atom or gram atomic weight — The mass in grams numerically equal to the atomic weight.

Gram equivalent of a substance is the weight of a substance displacing or otherwise reacting with 1.008 g of hydrogen or combining with one-half of a gram atomic weight (8.00 g) of oxygen.

Gram molecular weight or gram molecule — A mass in grams of a substance numerically equal to its molecular weight. Gram mole.

Gram mole, gram formula weight, gram equivalent — Mass in grams numerically equal to the molecular weight, formula weight or chemical equivalent, respectively.

Gravitation — The acceleration produced by the mutual attraction of two masses, directed along the line joining their centers of masses, and of magnitude inversely proportional tothe square of the distance between the two centers of mass.

This acceleration on a unit mass has the magnitude $G(m/r^2)$, where m is the mass of the attracting body, r is the distance between the centers of mass, and G is the gravitational constant equal to $6.670 \pm 0.005 \times 10^{-8}$ cm^2/gram sec.^{2}

In the case of masses in the earth's gravitational field, m is the mass of the earth, equal to 5.975×10^{27} g. However, the rotation of the earth and atmosphere modifies this field to produce the field of gravity.

Gravitational constant (symbol G) — The coefficient of proportionality in Newton law of gravitation

$$G = 6.670 \pm 0.005 \times 10^{-8} \text{ dyne-centimeter squared per gram squared.}$$

Also called constant of gravitation, Newtonian universal constant of gravitation.

Gravity — 1. Viewed from a frame of reference fixed in the earth, force imparted by the earth to a mass which is at rest relative to the earth. Since the earth is rotating, the force observed as gravity is the resultant of the force of gravitation and the centrifugal force arising from this rotation and the use of an earthbound rotating frame of reference. It is directed normal to sea level and to its geopotential surfaces. See Virtual gravity, Geopotential height.

The magnitude of the force of gravity at sea level decreases from the poles, where the centrifugal force is zero, to the equator, where the centrifugal force is a maximum but directed opposite to the force of gravitation. This difference is accentuated by the shape of the earth, which is nearly that of an oblate spheroid of revolution slightly depressed at the poles. Also, because of the asymmetric distribution of the mass of the earth, the force of gravity is not directed precisely toward the earth's center.

The magnitude of the force of gravity is usually called either gravity, acceleration of gravity, or apparent gravity.

Half life — The average time required for one half the atoms in a sample of radioactive element to decay.

The half life $t\frac{1}{2}$ is given by

$$t_{1/2} = (\ln 2)/\lambda$$

where λ is the decay constant.

Half-wave plate — An electro-optical material used to rotate the plane of polarization of a light beam.

Hall constant — In an electrical conductor, the constant of proportionality R in the relation

$$E_h = RJ \times H$$

where E_h is transverse electric field (Hall field); J is current density; and H is magnetic field.

The sign of the majority carrier can be inferred from the sign of the Hall constant.

Hall effect — When a steady current is flowing in a steady magnetic field, electromotive forces are developed which are at right angles both to the magnetic force and to the current and are proportional to the product of the intensity of the current, the magnetic force and the sine of the angle between the directions of these quantities.

Hall mobility — A measure of the flow of charged particles perpendicular to both a magnetic and an electric field.

Hardness — Property of substances determined by their ability to abrade or indent one another. An arbitrary scale of hardness is based upon ten selected minerals. For metals the diameter of the indentation made by a hardened steel sphere (Brinnell) or the height of rebound of a small drop hammer (Shore Scleroscope) serve to measure hardness.

Harmonic — A sinusoidal quantity whose frequency is an integral multiple of some fundamental frequency, that is, given a quantity, x(t), where

$$x(t) = A\cos(\omega t + \phi),$$

its harmonics, $h_n(x)$ are of the form

$$h_n(x) = A_n \cos(n\,\omega t + \phi_n),$$

where n is an integer larger than 1.

Harmonic motion — See Simple harmonic motion and Angular harmonic motion.

Heat — Energy transferred by a thermal process.

Heat can be measured in terms of the dynamical units of energy, as the erg, joule, etc., or in terms of the amount of energy required to produce a definite thermal change in some substance, as, for example, the energy required per degree to raise the temperature of a unit mass of water at some temperature (calorie, Btu).

Heat capacity — That quantity of heat required to increase the temperature of a system or substance one degree of temperature. It is usually expressed in calories per degree centigrade or joules per degree centigrade.

Molar heat capacity is the quantity of heat necessary to raise the temperature of one molecular weight of the substance one degree.

Heat effect — The heat in calories developed in a circuit by an electric current of I amperes flowing through a resistance of R ohms, with a difference of potential E volts for a time t seconds.

$$H = \frac{RI^2t}{4.18} = \frac{Eit}{4.18}$$

Heat equivalent, or latent heat, or fusion — The quantity of heat necessary to change one gram of solid to a liquid with no temperature change. Dimensions, $[l^2 t^{-2}]$.

Heat of combustion of a substance is the amount of heat evolved by the combustion of 1 g mol wt of the substance.

Heat quantity — The cgs unit of heat is the calorie, the quantity of heat necessary to change the temperature of one gram of water from 3.5°C to 4.5°C (called a small calorie). If the temperature change involved is from 14.5 to 15.5°C, the unit is the normal calorie. The mean calorie is $\frac{1}{100}$ the quantity of heat necessary to raise one gram of water from 0°C to 100°C. The large calorie is equal to 1000 small calories. The British thermal unit is the heat required to raise the temperature of one pound of water at its maximum density, 1°F. It is equal to about 252 calories. Dimensions of energy, $[ml^2t^{-2}]$.

Hecto — A prefix meaning hundred or 10^2. Symbol is h.

Hehner number (value) — A number expressing the percentage (i.e. grams per hundred grams) of water-insoluble fatty acids in an oil or fat.

Heisenberg's theory of atomic structure — The currently accepted view of the structure of atom, formulated by Heisenberg in 1934, according to which the atomic nuclei are built of nucleons, which may be protons or neutrons, while the extranuclear shells consist of electrons only. The nucleons are held together by nuclear forces of attraction, with exchange forces operating between them. The number of protons is equal to the atomic number (Z) of the element, the number of neutrons is equal to the difference between the mass number and the atomic number (A — Z). The number of excess neutrons, i. e. the excess of neutrons over protons, is of paramount importance for the radioactive properties or stability of the element.

Helmholtz free energy = Helmholtz function.

Helmholtz function (symbol a) — A mathematically defined thermodynamic function of state, the decrease in which during a reversible isothermal process is equal to the work done by the system. The Helmholtz function is

$$a = u - Ts$$

where u is specific internal energy; T is Kelvin temperature; and s is specific entropy. By use of the first law of thermodynamics for reversible processes,

$$da = -s\,dT - dw$$

where dw is the work done per unit mass by the system. Also called Helmholtz free energy, work function. Compare Gibbs function.

Henry (unit of electric inductance) — The inductance of a closed circuit in which an electromotive force of 1 V is produced when the electric current in the circuit varies uniformly at a rate of 1 A/sec.

Henry's law — The mass of a slightly soluble gas that dissolves in a definite mass of a liquid at a given temperature is very nearly directly proportional to the partial pressure of that gas. This holds for gases which do not unite chemically with the solvent.

Hertz — The measure of frequency, defined as equal to 1 cycle/sec.

Hess' law of constant heat summation — The amount of heat generated by a chemical reaction is the same whether reaction takes place in one step or in several steps, or all chemical reactions which start with the same original substances and end with the same final substances liberate the same amounts of heat, irrespective of the process by which the final state is reached.

Heterodyne — To mix two radio signals of different frequencies to produce a third signal which is of lower frequency; i.e., to produce beating.

Radar receivers are of the heterodyne type (as contrasted to the superregenerative type) because the very high radio frequencies used in radar are difficult to amplify. A target signal is heterdyned with a current of lower frequency produced by a klystron oscillator and the resulting intermediate-frequency signal can then be highly amplified for subsequent presentation or analysis.

Hobbmann orbit — A minimum energy transfer orbit.

Hole — A mobile vacancy in the electronic valence of structure of a semiconductor which acts like an electron with a positive charge.

Holocamera — A device for recording or forming a hologram of an object or subject.

Hologram — A recording or picture of a three-dimensional wavefront.

Holographic — Pertaining to or using the principles of holography. For example, holographic equipment uses the principles of holography for its operation.

Holographic matched filter — A particular type of hologram which when illuminated by the type wave it is matched to will transmit a pure plane wave. This plane wave is usually focused into a correlation spot.

Holography — A recording and viewing process which allows reconstruction of three-dimensional images of diffuse objects.

Homogeneous atmosphere — 1. A hypothetical atmosphere in which the density is constant with height.

The lapse rate of temperature in such an atmosphere is known as the autoconvective lapse rate and is equal to g/R (or approximately 3.4°C/100 m) where g is the acceleration of gravity and R is the gas constant for air. A homogeneous atmosphere has a finite total thickness which is given by R_dT_v/g, where R_d is the gas constant for dry air and T_v is the virtual temperature (°K) at the surface. For a surface temperature of 273°K, the vertical extent of the homogeneous atmosphere on the earth is approxiamtely 8000 m. At the top of such an atmosphere both the pressure and absolute temperature vanish.

2. With respect to radio propagation, an atmosphere which has a constant index of refraction, or one in which radio waves travel in straight lines at constant speed. Free space is the ideal homogeneous atmosphere in this sense. 3. Same as adiabatic atmosphere. See Barotrophy.

Hooke's law — Within the elastic limit of any body the ratio of the stress to the strain produced is constant.

Horsepower — A measure of power, defined as equal to 33,000 foot pounds/min, or 746 watts.

Humidity, absolute — Mass of water vapor present in unit volume of the atmosphere, usually measured as grams per cubic meter. It may also be expressed in terms of the actual pressure of the water vapor present.

Huygens' principle — A very general principle applying to all forms of wave motion which states that every point on the instantaneous position of an advancing phase front (wave front) may be regarded as a source of secondary spherical wavelets. The position of the phase front a moment later is then determined as the envelope of all the secondary wavelets (ad infinitum).

Huygens' theory of light — This theory states that light is a disturbance traveling through some medium, such as the ether. Thus light is due to wave motion in ether.

Every vibrating point on the wave-front is regarded as the center of a new disturbance. These secondary disturbances traveling with equal velocity, are enveloped by a surface identical in its properties with the surface from which the secondary disturbances start and this surface forms the new wave-front.

Hydrogen equivalent of a substance is the number of replaceable hydrogen atoms in 1 mol or the number of atoms of hydrogen with which 1 mol could react.

Hydrogen ion concentration — The concentration of hydrogen ions in solution when the concentration is expressed as gram-ionic weights per liter. A convenient form of expressing hydrogen ion concentration is in terms of the negative logarithm of this concentration. The negative logarithm of the hydrogen ion concentration is called pH.

Water at 25°C has a concentration of H ion of 10^{-7} and of OH ion of 10^{-7} moles per liter. Thus the pH of water is 7 at 24°C. A greater accuracy is obtained if one substitutes the thermodynamic activity of the ion for its concentration.

Hydrolysis is a double decomposition reaction involving the splitting of water into its ions and the formation of a weak acid or base or both.

Hydrostatic equation — In numerical equations, the form assumed by the vertical component of the vector equation of motion when all coriolis, earth-curvature, frictional, and vertical-acceleration terms are considered negligible compared with those involving the vertical pressure force and the force of gravity. Thus,

$$dP = -\rho g dZ$$

where P is the atmospheric pressure; ϱ is the density; g is the acceleration of gravity; and Z is the geometric height.

Hydrostatic pressure at a distance h from the surface of a liquid of density d,

$$P = hdg$$

The total force on an area A due to hydrostatic pressure,

$$F = P\ A = Ahdg$$

Force in dynes and pressure in dynes per cm^2 will be given if h is in cm, d in g per cm^3 and g in cm per sec.^{2}

Hyperon — Any article with mass intermediate between that of the neutron and the deuteron. See Meson.

Hypersonic — 1. Pertaining to hypersonic flow. 2. Pertaining to speeds of Mach 5 or greater.

Hypersonic flow In aerodynamics, flow of a fluid over a body at speeds much greater than the speed of sound and in which the shock waves start at a finite distance from the surface of the body. Compare supersonic flow.

Hysteresis — The magnetization of a sample of iron or steel due to a magnetic field which is made to vary through a cycle of values, lags behind the field. This phenomenon is called hysteresis.

Steinmetz' equation for hysteresis gives the loss of energy in ergs per cycle per cm ^{3},

$$W = \eta B^{1.6}$$

where B is the maximum induction in maxwells per cm^2 and η the coefficient of hysteresis.

Ice point — The temperature at which a mixture of air-saturatated pure water and pure ice may exist in equilibrium at a pressure of one standard atmosphere.

By decision of the Tenth General Conference on Weights and Measures, Paris, October 1954 the ice point was established as 273.15°K.

Ideal gas — A gas which conforms to Boyle's law and has zero heat of free ezpansion (or also obeys Charles' law). Also called perfect gas.

Illuminance — The total luminous flux received on a unit area of a given real or imaginary surface, expressed in such units as the footcandle, lux, or phot. Illuminance is analogous to irradiance, but is to be distinguished from the latter in that illuminance refers only to light and contains the luminous efficiency weighting factor necessitated by the nonlinear wavelength-response of the human eye. Compare luminous intensity.

The only difference between illuminance and illumination is that the latter always refers to light incident upon a material surface.

A distinction should be drawn, as well, between illuminance and luminance. The latter is a measure of the light coming from a surface; thus, for a surface which is not self-luminous, luminance is entirely dependent upon the illuminance upon that surface and its reflection properties.

Illumination on any surface is measured by the luminous flux incident on unit area. The units in use are: the lux, (abbreviation lx) one lumen per square meter; the phot, (abbreviation ph) one lumen per square centimeter; the footcandle, (abbreviation fc) one lumen per square foot.

Image redundancy — Multiple storage of the same image.

Impact pressure — 1. That pressure of a moving fluid brought to rest which is in excess of the pressure the fluid has when it does not flow, i.e., total pressure less static pressure.

Impact pressure is equal to dynamic pressure in incompressible flow, but in compressible flow impact pressure includes the pressure change owing to the compressibility effect.

2. A measured quantity obtained by placing an open-ended tube, known as an impact tube or pitot tube, in a gas stream and noting the pressure in the tube on a suitable manometer.

Since the pressure is exerted at a stagnation point, the impact pressure is sometimes referred to as the stagnation pressure or total pressure.

Incandescence — Emission of light due to high temperature of the emitting material. Any other emission of light is called luminescence.

Incoherent holography — Holograms produced initially from conventional photographs or incoherent optical equipment.

Indeterminacy principle (Uncertainty principle) — The postulate that it is impossible to determine simultaneously both the exact position and the exact momentum of an electron. So this aspect of electronics can only be expressed as a probability.

Index of refraction (symbol n) — 1. A measure of the amount of refraction (a property of a dielectric substance). It is the ratio of the wavelength or phase velocity of an electromagnetic wave in a vacuum to that in the substance. Also called refractive index, absolute index of refraction, absolute refractive index, refractivity. See modified index of refraction, N-unit, potential index of refraction.

It can be a function of wavelength, temperature, and pressure. If the substance is nonabsorbing and nonmagnetic at any wavelength, then n^2 is equal to the dielectric constant at that wavelength.

The complex index of refraction is obtained when the attenuation of the wave per radian, called the absorptive index k, is paired with the index of refraction. It is written

$$n^* = n(1 - ik)$$

When the wave passes from one medium n_1 to another n_2, the angle of incidence ϕ and the angle of refraction ϕ', both measured with respect to the normal to the interface, are related by

$$\sin\phi/\sin\phi' = n_1{}^*/n_2{}^* = \text{constant}$$

which becomes, for a nonabsorbing medium, the ratios of the (noncomplex) indices of refraction. In the particular case that medium 2 is a vacuum, this ratio is the index of refraction of medium 1. This is known as Snell law, named after Willebrord Snell who discovered it about 1621.

2. A measure of the amount of refraction experienced by a ray as it passes through a refraction interface, i.e., a surface separating two media of different densities. It is the ratio of the absolute indices of refraction of the two media (see sense 1 above). Also called refractive index, relative index of refraction.

Indicators are substances which change from one color to another when the hydrogen ion concentration reaches a certain value, different for each indicator.

Indirectly ionizing particles are uncharged particles (neutrons, photons, etc.) which can liberate directly ionizing particles or can initiate nuclear transformations.

Induced electromotive force in a circuit is proportional to the rate of change of magnetic flux through the circuit.

$$E = -\frac{d\phi}{dt}$$

where $d\phi$ is the change of magnetic flux in a time dt. The induced current will be given by

$$I = \frac{d\phi}{Rdt}$$

where R is the resistance of the circuit.

Inductance — The change in magnetic field due to the variation of a current in a conducting circuit causes an induced counter electromotive force in the circuit itself. This phenomenon is known as self-induction. If an electromotive force is induced in a neighboring circuit the term mutual induction is used. Inductance may thus be distinguished as self- or mutual and is measured by the electromotive force produced in a conductor by unit rate of variation of the current. Units of inductance are the centimeter (absolute electromagnetic) and the henry, which is equal to 10^9 centimeters of inductance. The henry is that inductance in which an induced electromotive force of one volt is produced when the inducing current is changed at the rate of one ampere per second. Dimensions, $[\epsilon^{-1}\ l^{-1}\ t^2]$; $[\mu l]$.

Induction — Any change in the intensity or direction of a magnetic field causes an electromotive force in any conductor in the field. The induced electromotive force generates an induced current if the conductor forms a closed circuit.

Inertia — The resistance offered by a body to a change of its state of rest or motion, a fundamental property of matter. Dimension, [m].

Information content — Containing or transmitting data involving new knowledge. When applied to waves or wavefronts, it includes both amplitude and phase of all parts of a wavefront at a given instant of time.

Infrared radiation (abbr. IR) — Electromagnetic radiation lying in the wavelength interval from about 75 μm to an indefinite upper boundary sometimes arbitrarily set at 1000 μm (0.01 cm). Also called long-wave radiation.

Inline holography — Hologram produced by single reference beam interferences with waves diffracted or scattered from a small object.

Insolation — (Contracted from incoming solar radiation.) 1. In general, solar radiation received at the earth's surface. See terrestrial radiation, extraterrestrial radiation, direct solar radiation, global radiation, effective terrestrial radiation, diffuse sky radiation, atmospheric radiation. 2. The rate at which direct solar radiation is incident upon a unit horizontal surface at any point on or above the surface of the earh. Compare solar constant.

Intensity of Illumination (properly called Illumination)—Illumination in lux of a screen by a source of illuminating power P at a distance r meters, for normal incidence,

$$I = \frac{P}{r^2}$$

If two sources of illuminating power P_1 and P_2 produce equal illumination on a screen when at distances r_1 and r_2 respectively,

$$\frac{P_1}{r_1{}^2} = \frac{P_2}{r_2{}^2} \quad \text{or} \quad \frac{P_1}{P_2} = \frac{r_1{}^2}{r_2{}^2}$$

If I_o is the illumination when the screen is normal to the incident light, then I is the illumination when the screen is at an angle θ. Thus,

$$I = I_0 \cos\theta$$

Intensity of magnetization is given by the quotient of the magnetic moment of a magnet by its volume. Unit intensity of magnetization is the intensity of a magnet which has unit magnetic moment per cubic centimeter. Dimensions, $[\epsilon^{-1/2}\ m^{-1/2}\ l^{-3/2}];[\mu^{1/2}\ m^{1/2}\ l^{-1/3}\ t^{-1}]$.

Intensity of radiation is the rate of transfer of energy across unit areas by the radiation. In all forms of energy transfer by waves (radiation) the intensity I is given by I = U, where U is the energy density of the wave in the medium, and v is the velocity of propagation of the wave. The energy density U is always proportional to the square of the wave amplitude.

Intensity of sound depends upon the energy of the wave motion. The intensity is measured by the energy in ergs transmitted per second through 1 cm^3 of surface. The energy in ergs per cm^3 in a sound wave is given by

$$E = 2\pi^2 dn^2 a^2$$

where d is density in g per cm^3, n is frequency in vib. per sec and a is amplitude in cm. The energy reaching the ear in unit time will also be proportional to the velocity of propagation.

Interference hologram — A holographic interferogram produced by the superposition of two or more hologram exposures.

Interference (of waves) — The coherent addition or subtraction of two different wavefronts, which usually forms a third wave different from the first two.

Interference pattern — The pattern of light and dark fringes produced when two or more coherent waves interfere or intersect.

Interferogram — The record of an interference pattern produced by holography or by conventional optical interference techniques.

Interferometry (holographic) — The process of measuring very small movements or deformations by recording or observing interference wave patterns (either light, electronic, or acoustic).

Interionic attraction — The electrostatic attraction between ions of unlike charge (sign).

Interionic repulsion — The electrostatic repulsion between ions of like charge (sign).

Internal energy — A mathematically defined thermodynamic function of state, interpretable through statistical mechanics as a measure of the molecular activity of the system. It appears in the first law of thermodynamics as

$$du - dq - dw$$

where du is the increment of specific internal energy, dq the increment of heat, and dw the increment of work done by the system per unit mass. The differential du is a perfect differential. Its integral therefore introduces a constant of integration, the zero-point internal energy, so that care must be taken when absolute values of the internal energy are employed.

International Practical Kelvin Temperature Scale of 1960 and the **International Practical Celsius Temperature Scale of 1960** are defined by a set of interpolation equations based on the following reference temperatures:

	°K	°C
Oxygen, liquid-gas equilibrium	90.18	−182.97
Water, solid-liquid equilibrium	273.15	0.00
Water, solid-liquid-gas equilibrium	273.16	0.01
Water, liquid-gas equilibrium	373.15	100.00
Zinc, solid-liquid equilibrium	692.655	419.505
Sulphur, liquid-gas equilibrium	717.75	444.6
Silver, solid-liquid equilibrium	1233.95	960.8
Gold, solid-liquid equilibrium	1336.15	1063.0

International System of Units (abbr. SI) — The metric system of units based on the meter, kilogram, second, ampere, Kelvin degree, and candela. Also called MSKA system.

Iodine number (value) — A number expressing the percentage (i.e. grams per 100 grams) of iodine absorbed by a substance. It is a measure of the proportion of unsaturated linkages present and is usually determined in the analysis of oils and fats.

Ion — An ion is an atom or group of atoms that is not electrically neutral but instead carries a positive or negative electric charge. Positive ions are formed when neutral atoms or molecules lose valence electrons; negative ions are those which have gained electrons.

Ion atmosphere (or continuus charge distribution) — In the electrostatic effects between ions the term ion atmosphere denotes a continuous charge distribution, or charge density, ϱ(r), which is a continuous function of r, the distance from the reference ion, rather than a discrete or discontinuous charge distribution. The ion atmosphere extends from r = a to $r = 0(V^{1/_3}) \approx \infty$, where V is the volume of the system, and acts electrostatically somewhat like a sphere of charge −e at a distance, k^{-1}, from the reference ion of charge +e (see below for definition of k^{-1}).

Ionic equivalent conductance, λ — The ionic equivalent conductance is the equivalent conductance of an individual ion constituent of the solute (or electrolyte) of an electrolytic solution. This symbol is also used to designate the equivalent conductance of complex ions, ion pairs, ion clusters, etc., in combination with simple ions.

Ionic mobility, μ — The mobility of an ion at any finite equivalent concentration is the velocity with which the ion moves under unit potential gradient. Its unit is $cm^2\ sec^{-1}\ volt^{-1}\ equiv^{-1}$ or $cm^2\ ohm^{-1}\ F^{-1}$ where F is the Faraday expressed in coulombs (or ampere seconds) $equiv^{-1}$.

Ionization — The process by which neutral atoms or groups of atoms become electrically charged, either positively or negatively, by the loss or gain of electrons; or the state of a substance whose atoms or groups of atoms have become thus charged.

Ionization potential — The work (expressed in electron volts) required to remove a given electron from its atomic orbit and place it at rest at an infinite distance. It is customary to list values in electron volts (ev.) 1 ev. = 23,053 calories per mole.

Ionizing radiation is any radiation consisting of directly or indirectly ionizing particles or a mixture of both.

Ionogens — Substances, like acetic acid (HAc), which, although in the pure state are nonelectrolytic neutral molecules, can react with certain solvents to form products which rearrange to ion pairs which then dissociate to give conducting solutions. As an example:

$$HAc + H_2O \rightleftharpoons HAc \cdot H_2O \rightleftharpoons H_3O^+ \cdot Ac^- \rightleftharpoons H_3O^+ + Ac^-$$

Ionophores — Substances, like sodium chloride, which exist only as ionic lattices in the pure crystalline form, and which when dissolved in an appropriate solvent give conductances which change according to some fractional power of the concentration. Such solutions possess no neutral molecules which can dissociate, but may contain associated ions.

Ionosphere — The atmospheric shell characterized by a high ion density. Its base is at about 70 or 80 km and it extends to an indefinite height.

Ion size or "ion-size" parameter, a (or a_i) — The ion size is formally considered to be the sum of the ionic radii of the oppositely charged ions in contact. The ion size is also called the "distance of closest approach" of the ions, or the "ion-size" parameter. Generally the ion size is greater than the sum of the crystal radii, and the "ion-size" parameter may include several factors which contribute to its numerical value.

Irradiance — A measure of the rate of energy falling on a given area.

Isentropic — Of equal or constant entropy with respect to either space or time.

Isobaric — Of equal or constant pressure, with respect to either space or time.

Isobars — For chemistry, elements of the same atomic mass but of different atomic numbers. The sum of their nucleons is the same but there are more protons in one than in the other.

Isochoric — Of equal or constant volume, usually applied to a thermodynamic process during which the volume of the system remains unchanged. Compare isosteric.

Isoclinic line — A line through points on the earth's surface having the same magnetic dip.

Isomer — 1. One of two or more nuclides having the same mass number A and atomic number Z, but existing for measurable times in different quantum states with different energies and radioactive properties.
2. One of two or more molecules having the same atomic composition and molecular weight, but differing in geometrical configuration.

Isomerism — Existence of molecules having the same number and kinds of atoms but in different configurations.

Isotherm — A line of equal or constant temperature.
A distinction is made, infrequently, between a line representing equal temperature in space, choroisotherm, and one representing constant temperature in time, chronoisotherm.

Isothermal — When a gas passes through a series of pressure and volume variations without change of temperature the changes are called isothermal. A line on a pressure-volume diagram representing these changes is called an isothermal line.

Isotope — 1. One of several nuclides having the same number of protons in their nuclei, and hence belonging to the same element, but differing in the number of neutrons and therefore in mass number A, or in energy content (isomers). For example, ${}_6C_6^{12}$, ${}_6C_7^{13}$, and ${}_6C_8^{14}$ are carbon isotopes. Small quantitative differences in chemical properties exist between isotopes.

Isotropic — In general, pertaining to a state in which a quantity or spatial derivatives thereof are independent of direction. Also called isotropous.

Joule constant — The ratio between heat and work units from experiments based on the first law of thermodynamics: 4.1858×10^7 ergs per 15° calorie. Also called mechanical equivalent of heat.

Joule — A unit of energy or work in the MKS system; the work done when the point of application of 1 newton is displaced a distance of 1 meter in the direction of the force.

$$1 \text{ joule} = 10^7 \text{ ergs} = 1 \text{ watt second}$$

Joule cycle — (After James Prescott Joule, 1818—1889, English physicist.) An ideal cycle for engines consisting of isentropic compression of the working substance, addition of heat at constant pressure, isentropic expansion to ambient pressure, and exhaust at constant pressure. Also called Brayton cycle.

Joule's law — A law stating that the amount of heat H produced in a conductor by the flow of a steady current I is given by

$$H = KI^2Rt,$$

where R is the resistance of the conductor, t is the time for which the current flows, and K, the constant of proportionality, has the value 0.2390 calories per joule when R is in ohms and I in amperes.

Joule-Thomson effect — The decrease in temperature which takes place when a gas expands through a throttling device as a nozzle. Also called Joule-Kelvin effect.

The rate of change of temperature T with pressure p in the Joule-Thomson effect is called the Joule-Thomson coefficient (symbol μ):

$$\mu = \left[\frac{dT}{dp}\right]_h$$

where h denotes constant enthalpy.

For the Joule-Thomson effect to take place the gas must initially be below its inversion temperature; if above the inversion temperature, the gas will gain heat on expansion. The inversion temperature of hydrogen, for example, is approximately −183°C.

Junction — In a semiconductor device, a region of transition between semiconducting regions of different electrical properties.

Kelvin — The kelvin, the unit of thermodynamic temperature, is the fraction 1/273.16 of the thermodynamic temperature of the triple point of water. The decision was made at the 13th General Conference on Weights and Measures on October 13, 1967 that the name of the unit of thermodynamic temperature would be changed from degree Kelvin (symbol: °K) to kelvin (symbol: K). The name (kelvin) and symbol (K) are to be used for expressing temperature intervals. The former convention which expressed a temperature interval in degrees Kelvin or, abbreviated, deg. K is dropped. However, the old designations are acceptable temporarily as alternatives to the new ones. One may also express temperature intervals in degrees Celsius.

Kelvin temperature scale (abbr. K)—An absolute temperature scale independent of the thermometric properties of the working substance. On this scale, the difference between two temperatures T_1 and T_2 is proportional to the heat converted into mechanical work by a Carnot engine operating between the isotherms and adiabats through T_1 and T_2. Also called absolute temperature scale, thermodynamic temperature scale.

For convenience the Kelvin degree is identified with the Celsius degree. The ice point in the Kelvin scale is 273.15°K. The triple point of water, the fundamental reference point, is 273.16°K. See Absolute zero, Rankine temperature scale.

Kepler's laws — I. The planets move about the sun in ellipses, at one focus of which the sun is situated. II. The radius vector joining each planet with the sun describes equal areas in equal times. III. The cubes of the mean distances of the planets from the sun are proportional to the squares of their times of revolution about the sun.

Kerr cell — A cell that contains electrodes immersed in nitrobenzene or other liquid. It shows double refraction in high degree and with short time lag. Used in devices in which light intensity is changed rapidly according to the voltage applied to the electrons.

Kerr effect — When plane polarized light is incident on the pole of an electromagnet, polished so as to act like a mirror, the plane of polarization of the reflected light is not the same when the magnet is "on" as when it is "off." It was found that the direction of rotation was opposite to that of the currents exciting the pole from which the light was reflected.

Kilo — A prefix meaning thousand or 10^3. Symbol is k.

Kilogram (unit of mass)—is the mass of a particular cylinder of platinum-iridium alloy, called the International Prototype Kilogram, which is preserved in a vault at Sèvres, France, by the International Bureau of Weights and Measures.

Kilometer (abbr. km) — A unit of distance in the metric system.

1 kilometer = 3280.8 feet = 1093.6 yards = 1000 meters = 0.62137 statute miles = 0.53996 nautical miles.

Kinematic viscosity (symbol v) — A coefficient defined as the ratio of the dynamic viscosity of a fluid to its density.

The kinematic viscosity of most gases increases with increasing temperature and decreasing pressure. For dry air at 0°C, the kinematic viscosity is about 0.13 square centimeter per second. In the theory of atmospheric turbulence the kinematic viscosity is usually replaced by the kinematic eddy viscosity to account for the increased internal friction due to turbulence.

Kinetic energy (symbol E_k) — The energy which a body possesses as a consequence of its motion, defined as one-half the product of its mass m and the square of its speed v, $\frac{1}{2}mv^2$. The kinetic energy per unit volume of a fluid parcel is thus $\frac{1}{2}\varrho v^2$, where ϱ is the density and v the speed of the parcel. See Potential energy.

For relativistic speeds the kinetic energy is given by

$$E_k = mc^2 - m_0 c^2$$

where c is the velocity of light in a vacuum, m_0 is the rest mass, and m is the moving mass.

Kinetic theory, expression for pressure —

$$P = \frac{1}{3} N mv^2$$

where N is the number of molecules in unit volume, m the mass of each molecule and v^2 the mean square of the velocity of the molecules.

Kinetic theory of gases — Gases are considered to be made up of minute, perfectly elastic particles which are ceaselessly moving about with high velocities, colliding with each other and with the walls of the containing vessel. The pressure exerted by a gas is due to the combined effect of the impacts of the moving molecules upon the walls of the containing vessel, the magnitude of the pressure being dependent upon the kinetic energy of the molecules and their number.

Kirchhoff law—The radiation law which states that at a given temperature the ratio of the emissivity to the absorptivity for a given wavelength is the same for all bodies and is equal to the emissivity of an ideal black body at that temperature and wavelength.

Kirchhoff's laws —

I. The algebraic sum of the currents which meet at any point is zero.

II. In any closed circuit the algebraic sum of the products of the current and the resistance in each conductor in the circuit is equal to the electromotive force in the circuit.

Kirchhoff's laws of radiation — The relation between the powers of emission and the powers of absorption for rays of the same wave-length is constant for all bodies at the same temperature. First, a substance when excited by some means or other possesses a certain power of emission; it tends to emit definite rays, whose wave-lengths depend upon the nature of the substance and upon the temperature. Second, the substance exerts a definite absorptive power, which is a maximum for the rays it tends to emit. Third, at a given temperature the ratio between the emissive and the absorptive power for a given wave-length is the same for all bodies, and is equal to the emissive power of a perfectly black body.

Knot — A nautical mile per hour, 1.1508 statute miles per hour.

Kohlrausch law of independent migration of ions — The value of the equivalent conductance, as the concentration approaches zero, is equal to the sum of the limiting ionic equivalent conductances of the ions constituting the solute of the electrolytic solution.

Kundt's law — On approaching an absorption band from the red side of the spectrum the refractive index is abnormally increased by the presence of the band, while the approach is from the blue side and the index is abnormally decreased.

Lambert (abbr. L or l) — A unit of luminance (or brightness) equal to $1/\pi$ candle per square centimeter. Physically, the lambert is the luminance of a perfectly diffusing white surface receiving an illuminance of 1 lumen/cm².

Lambert law — A law of physics which states that the radiant intensity (flux per unit solid angle) emitted in any direction from a unit radiating surface varies as the cosine of the angle between the normal to the surface and the direction of the radiation. The radiance (or luminance) of a radiating surface is, therefore, independent of direction. Also called Lambert cosine law.

Lambert law of absorption = Bouguer law.

Lambert's law of absorption — Each layer of equal thickness absorbs an equal fraction of the light which traverses it.

Lambert's law of illumination — The illumination of a surface on which the light falls normally from a point source is inversely proportional to the square of the distance of the surface from the source. If the normal to the surface makes an angle with the direction of the rays, the illumination is proportional to the cosine of that angle.

Landau damping — The damping of a space charge wave by electrons which move at the phase velocity of the wave and gain energy transferred from the wave.

Langley — A unit of energy per unit area, equal to 1 gram-calorie/cm² commonly employed in radiation theory.

Langmuir probe — A small metallic conductor or pair of conductors inserted within a plasma in order to sample the plasma current.

Lanthanide series (Lanthanides) — Rare earth elements of atomic numbers 57 through 71, which have chemical properties similar to lanthanum (#57).

Laplacian speed of sound — The phase speed of a sound wave in a compressible fluid if the expansions and compressions are assumed to be adiabatic. This speed a is given by the formula

$$a^2 = (c_p/c_v)\, RT$$

where c_p and c_v are the specific heats at constant pressure and volume, respectively; R is the gas content; and T is the Kelvin temperature. The value of this speed under standard conditions in dry air is 331 m/sec. Compare Newtonian speed of sound. See Acoustic velocity.

Laser — A device in which the excitation energy of resonant atomic or molecular systems is used to coherently amplify or generate light. Consider a system of particles with energy levels E_1, E_2 where $E_1 < E_2$. A particle passing between these levels absorbs or emits a quantum of radiation of frequency

$$v = (E_2 - E_1)/h$$

where h is Planck's constant. If N_1 is the number of particles in E_1 and N_2 the number in E_2, it follows from the laws of thermodynamics that at a positive absolute temperature $N_2 < N_1$. As a result of this, a wave of the appropriate frequency would be attenuated. If by some means N_2 can be made to exceed N_1 by a reasonably large margin, an incoming wave of frequency v will stimulate transitions from E_2 to E_1 and in the process become coherently amplified. For sustained oscillation to occur feedback must be provided; this is often done by covering the ends of the chamber in which the reaction occurs with reflective material and arranging the chamber to be resonant at the frequency of oscillation.

Latent heat of vaporization — The quantity of heat necessary to change one gram of liquid to vapor without change of temperature, measured as calories per gram. Dimensions, $[l^2t^{-2}]$.

Lattice energy — The energy required to separate the ions of a crystal to an infinite distance from each other.

LeChatelier's principle — If some stress is brought to bear upon a system in equilibrium, a change occurs, such that the equilibrium is displaced in a direction which tends to undo the effect of the stress.

Length — The name "micron", for a unit of length equal to 10^{-6} meter, and the symbol "μ" which has been used for it were dropped by action of the 13th General Conference on Weights and Measures on October 13, 1967. The symbol "μ" is to be used solely as an abbreviation for the prefix "micro-", standing for the multiplication by 10^{-6}. Thus the length previously designated as 1 micron, should be designated 1 μm.

Length, units of — Meter. 1. (Abbr. m) The basic unit of length of the metric system, defined as 1,650,763.73 wavelengths in vacuo of the unperturbed transition $2p^{10}-5d^5$ in krypton.[86]

Effective 1 July 1959 in the U.S. system of measures, 1 yard = 0.9144 meter, exactly, or 1 meter = 1.094 yards = 39.37 inches. The standard inch is exactly 25.4 millimeters.

Lenses — For a single thin lens whose surfaces have radii of curvature r_1 and r_2 whose principal focus is F, the index of refraction n, and conjugate focal distances f_1 and f_2,

$$\frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2} = (n - 1)\left(\frac{1}{r_1} + \frac{1}{r_2}\right)$$

For a thick lens, of thickness t,

$$F = \frac{nr_1 r_2}{(n - 1)[n(r_1 + r_2) - t(n - 1)]}$$

Combinations of lenses—If f_1 and f_2 are the focal lengths of two thin lenses separated by a distance d the focal length of the system,

$$F = \frac{f_1 f_2}{f_1 + f - d}$$

Lenz's law — When an electromotive force is induced in a conductor by any change in the relation between the conductor and the magnetic field, the direction of the electromotive force is such as to produce a current whose magnetic field will oppose the change.

Limiting equivalent conductance, Λ_o — The limiting equivalent conductance of an electrolytic solution, Λ_o, is expressed by $\Lambda_o \equiv \lim (\sigma_{corr}/c)$ where σ_{corr} is solution conductance corrected for solvent conductance and c is the equivalent concentration. Λ_o is the value which Λ approaches as the solution is diluted so far that the effects of interionic forces become negligible (and dissociation, in the case of ionogens, is essentially complete).

Limiting ionic equivalent conductance, λ_o — The limiting ionic equivalent conductance of an individual ion constituent of the solute (or electrolyte) of an electrolytic solution is given by $\lambda_o \equiv \lim (\lambda/c)$. This symbol is also used to designate the limiting equivalent conductances of complexions, ion pairs, ion clusters, etc., in combination with simple ions.

Limiting ionic mobility, u^o — The limiting mobility of an individual ion of a solute (or electrolte) is given by $u \equiv \lim u$.

Limiting molar conductance, Λ^m_o — The limiting molar conductance of an electrolytic solution, Λ^m_o, is expressed by $\Lambda^m_o \equiv \lim (\sigma_{corr}/m)$ where σ_{corr} is solution conductance corrected for solvent conductance and m is the molar concentration. Λ^m_o is the value which Λ^m approaches as the solution is diluted so far that the effects of interionic forces become negligible. Seldomly used.

Line of force — A term employed in the description of an electric or magnetic field. A line such that its direction at every point is the same as the direction of the force which would act on a small positive charge (or pole) placed at that point. A line of force is defined as starting from a positive charge (or pole) and ending on a negative charge (or pole).

The line (of force) is also used as a unit of magnetic flux, equivalent to the maxwell.

Lissajous figures — The path described by a particle which is simultaneously displaced by two simple harmonic motions at right angles, when the periods of the two motions are in the ratio of two small whole numbers, shows a variety of characteristic curves called Lissajous figures.

Liquid — A state of matter in which the molecules are relatively free to change their positions with respect to each other, but restricted by cohesive forces so as to maintain a relatively fixed volume.

Logarithm — A number m related to another number p by

$$B^m = p$$

where B is an arbitrarily chosen number larger than 1. Usually m is written $\log_B p$. Logarithms have the basic properties that

$$\log pq = \log p + \log q$$

and

$$\log p^q = q \log p$$

In the systems most often used B = 10 (common logarithms) or B = e = 2.71828...(natural logarithms). The common logarithm of p is written $\log_{10} p$ or simply log p; the natural logarithm of p is written $\log_e p$ or ln p. Logarithmic adj.

Longitudinal wave energy — Waves whose amplitude displacement is in the same or opposite direction as the motion.

Loschmidt's number — The number of molecules per unit volume of an ideal gas at 0°C and normal atmospheric pressure.

$$n_0 = (2.68719 \pm 0.0001) \times 10^{19}\ \text{cm}^{-3}$$

Loudness — The psychological response of the ear which is related to the physical quantity intensity. The loudness of a sound depends on frequency also since the ear responds more strongly to some frequency bands than to others. The loudness is roughly related to the cube root of the intensity, and for many purposes it is convenient to represent loudness as proportional to the logarithm of the intensity.

Lumen — The lumen is the unit of luminous flux. It is equal to the luminous flux through a unit-solid angle (steradian) from a uniform point source of one candle, or to the flux on a unit surface all points of which are at unit distance from a uniform point source of one candle.

Luminescence — Light emission by a process in which kinetic heat energy is not essential for the mechanism of excitation.

Electroluminescence is luminescence from electrical discharges—such as sparks or arcs. Excitation in these cases results mostly from electron or ion collision by which the kinetic energy of electrons or ions, accelerated in an electric field, is given up to the atoms or molecules of the gas present and causes light emission. Chemiluminescence results when energy, set free in a chemical reaction, is converted to light energy. The light from many chemical reactions and from many flames is of this type. Photoluminescence, or fluorescence, results from excitation by absorption of light. The term phosphorescence is usually applied to luminescence which continues after excitation by one of the above methods has ceased. Compare incandescence.

Luminous (energy) — Energy whose wavelength is such that the eye is sensitive to it.

Luminous flux — The total visible energy emitted by a source per unit time is called the total luminous flux from the source. The unit of flux, the lumen, is the flux emitted in unit solid angle (steradian) by a point source of one candle luminous intensity. A uniform point source of one candle intensity thus emits 4π lumens.

Luminous intensity or candlepower is the property of a source of emitting luminous flux and may be measured by the luminous flux emitted per unit solid angle. The accepted unit of luminous intensity is the international candle. The Hefner unit, which is equivalent to 0.9 international candles, is the intensity of a lamp of specified design burning amyl acetate, called the Hefner lamp.

The mean horizontal candlepower is the average intensity measured in a horizontal plane passing through the source. The mean spherical candlepower is the average candlepower measured in all directions and is equal to the total luminous flux in lumens divided by 4π.

Lux — A photometric unit of illuminance or illumination equal to 1 lumen/m^2. Compare footcandle, phot.

Magnetic Anisotropy — In ferro- or ferrimagnetic crystals, it is found that the magnetization prefers to lie along certain crystal directions. These are termed easy directions of magnetization. Work must be expended to turn the magnetization away from these easy directions. That work as a function of crystal direction defines the anisotropy energy surface. Directions associated with a maximum of the anisotropy energy are termed hard directions of magnetization. In general, the energy difference between easy and hard directions decreases as the temperature is increased, and vanishes at the Curie or Néel point.

Magnetic Domains — The magnetization of a ferromagnetic or a ferrimagnetic material tends to break up into regions called domains separated by thin transition regions called domain walls. Within the volume of a domain, the magnetization has its saturation value, and is directed along a single direction. The magnetizations of other domains are directed along different directions in such a way that the net magnetization of the whole sample may be zero. The application of an external magnetic field first causes some domains to grow by the motion of their walls. At higher fields, the magnetizations of the resulting domains rotate toward parallelism with the field.

Magnetic field due to a current — The intensity of the magnetic field in oersted at the center of a circular conductor of radius r in which a current I in absolute electromagnetic units is flowing,

$$H = \frac{2\pi I}{r}$$

If the circular coil has n turns the magnetic intensity at the center is,

$$H = \frac{2\pi n I}{r}$$

The magnetic field in a long solenoid of n turns per centimeter carrying a current I in absolute electromagnetic units

$$H = 4\pi n I$$

If I is given in amperes the above formulae become,

$$H = \frac{2\pi I}{10r} \qquad H = \frac{2\pi n I}{10r}. \qquad H = \frac{4\pi n I}{10}$$

Magnetic field due to a magnet — At a point on the magnetic axis prolonged, at a distance r cm from the center of the magnet of length 2l whose poles are + m and −m and magnetic moment M, the field strength in oersted is,

$$H = \frac{4mlr}{(r^2 \quad l^2)^2}$$

If r is large compared with l,

$$H = \frac{2M}{r^3}$$

At a point on a line bisecting the magnet at right angles, with corresponding symbols,

$$H = \frac{2ml}{(r^2 + l^2)^3}$$

For large value of r,

$$H = \frac{M}{r^3}$$

Magnetic field intensity or magnetizing force — Is measured by the force acting on unit pole. Unit field intensity, the oersted, is that field which exerts a force of one dyne on unit magnetic pole. The field intensity is also specified by the number of lines of force intersecting unit area normal to the field, equal numerically to the field strength in oersted. Magnetizing force is measured by the space rate of variation of magnetic potential and as such its unit may be the gilbert per centimeter. The gamma (γ) is equivalent to 0.00001 oersted. Dimensions, $[\varepsilon^{1/2}\, m^{1/2}\, l^{1/2}\, t^{-2}]$; $[\mu^{-1/2}\, m^{1/2}\, l^{-1/2}\, t^{-1}]$.

Magnetic flux through any area perpendicular to a magnetic field is measured as the product of the area by the field strength. The units of magnetic flux, the maxwell is the flux through a square centimeter normal to a field of one gauss. The line is also a unit of flux. It is equivalent to the maxwell. Dimensions, $[\varepsilon^{-1/2}\, m^{1/2}\, l^{1/2}]$; $[\mu^{1/2}\, m^{1/2}\, l^{1/2}\, t^{-1}]$.

Magnetic induction resulting when any substance is subjected to a magnetic field is measured as the magnetic flux per unit area taken perpendicular to the direction of the flux. The unit is the maxwell per square centimeter or its equivalent, the gauss. Dimensions, $[\varepsilon^{-1/2}\, m^{1/2}\, l^{-3/2}]$; $[\mu^{1/2}\, m^{1/2}\, l^{-1/2}\, t^{-1}]$.

If a substance of permeability μ is placed in a magnetic field H the magnetic induction in the substance,

$$M = \mu H.$$

If I is the magnetic moment for unit volume, or intensity of magnetization,

$$M = H + 4\pi I$$

The susceptibility,

$$k = \frac{I}{H}, \quad \mu \quad 1 + 4\pi k$$

Magnetic moment of a magnet is measured by the torque experienced when it is at right angles to a uniform field of unit intensity. The value of the magnetic moment is given by the product of the magnetic pole strength by the distance between the poles. Unit magnetic moment is that possessed by a magnet formed by two poles of opposite sign and of unit strength, 1 cm apart. Dimensions, $[\mu^{1/2}\, m^{1/2}\, l^{5/2}\, t^{-1}]$; $[\varepsilon^{-1/2}\, m^{1/2}\, l^{3/2}]$.

If the poles are separated by a distance which is great compared with the dimensions of the magnet, the magnetic moment of a magnet of length l whose poles have values of + m and −m is,

$$m = ml.$$

Magnetic permeability is a property of materials modifying the action of magnetic poles placed therein and modifying the magnetic induction resulting when the material is subjected to a magnetic field or magnetizing force. The permeability of a substance may be defined as the ratio of the magnetic induction in the substance to the magnetizing field to which it is subjected. The permeability of a vacuum is unity. Dimensions, $[\varepsilon^{-1}\, l^{-2}\, t^{2}]$; $[\mu]$.

Magnetic pole or quantity of magnetism — Two unit quantities of magnetism concentrated at points unit distance apart in a vacuum repel each other with unit force. If the distance involved is 1 cm and the force 1 dyn, the quantity of magnetism at each point is one cgs unit of magnetism. Dimensions, $[\varepsilon^{-1/2}\, m^{1/2}\, l^{1/2}]$; $[\mu^{1/2}\, m^{1/2}\, l^{3/2}\, t^{-1}]$.

Magnetic potential or magnetomotive force at a point measured by the work required to bring unit positive pole from an infinite distance (zero potential) to the point. The unit is the gilbert, that magnetic potential against which an erg of work is done when unit magnetic pole is transferred. Dimensions, $[\varepsilon^{1/2},\, m^{1/2}\, l^{3/2}\, t^{-2}]$; $[\mu^{-1/2}\, m^{1/2}\, l^{1/2}\, t^{-1}]$.

Magnetostriction — Change in sample dimensions as the magnitude or the direction of the magnetization in a crystal is changed.

Magnifying power of an optical instrument is the ratio of the angle subtended by the image of the object seen through the instrument to the angle subtended by the object when seen by the unaided eye. In the case of the microscope or simple magnifier the object as viewed by the unaided eye is supposed to be a distance of 25 cm (10 in.).

Maser — An abbreviation based on the English description of the function of this device, microwave amplification by stimulated emission of radiation.

Mass — Quantity of matter. **Units of mass**—the gram is $^{1}/_{1000}$ the quantity of matter in the International Prototype Kilogram; one of the three fundamental units of the cgs system. The British standard of mass is the pound, of which a standard is preserved by the government. The United States standard mass is the avoirdupois pound defined as 1/2.20462 kg.

The primary standard of the unit of mass is the international prototype of the kilogram kept at the BIPM. The mass of 1-kg secondary standards of platinum-iridium or of stainless steel is compared with the mass of the prototype by means of balances whose precision can reach 1 in 10^8 or better.

By an easy operation a series of masses can be standardized to obtain multiples and submultiples of the kilogram.

Mass — The inertial resistance of a body to acceleration, considered, in classical physics, to be a conserved quantity independent of speed. It can be shown that the parameters m_1, m_2 appearing in the gravitation equation are equivalent to the masses of the bodies in the sense given above. In relativistic physics it is shown that when the speed of a body becomes an appreciable fraction of c, the speed of light mass is given by

$$m = m_0/[1 - (v/c)^2]^{1/2}$$

where m_o is the rest mass of the body and v is its speed relative to the observer who finds its mass to be m. Further, it has been shown that mass and energy are interconvertible as given by Einstein's equation $E = mc^2$.

Mass action, law of — At a constant temperature the product of the active masses on one side of a chemical equation when divided by the product of the active masses on the other side of the chemical equation is a constant, regardless of the amounts of each substance present at the beginning of the action.

At constant temperature the rate of the reaction is proportional to the concentration of each kind of substance taking part in the reaction.

Mass and Weight — "1 The kilogram is the unit of mass; it is equal to the mass of the international prototype of the kilogram;

"2 The word weight[*] denotes a quantity of the same nature as a force; the weight of a body is the product of its mass and the acceleration due to gravity; in particular, the standard weight of a body is the product of its mass and the standard acceleration due to gravity;

"3 The value adopted in the international Service of Weights and Measures for the standard acceleration due to gravity is 980.665 cm/s², value already stated in the laws of some countries."

Mass by weighing on a balance with unequal arms— If W_1 is the value for one side, W_2 the value for the other, the true mass,

$$W = \sqrt{W_1 W_2}$$

Mass defect — Difference between atomic mass and mass number of a nuclide. See Packing fraction.

Mass-energy equivalence — The equivalence of a quantity of mass and a quantity of energy when the two quantities are related by the equation $E = mc^2$. The conversion factor c^2 is the square of the velocity of light. The relationship was developed from relativity theory, but has been experimentally confirmed.

Mass number — The whole number nearest the value of the atomic mass of an element as expressed in atomic mass units.

The mass number is assumed to represent the total number of protons and neutrons in the atomic nucleus of the element and is therefore equal to the atomic number plus the number of the neutrons. The mass number of an atom is usually written as a superscript to the element symbol, as in O^{18}, an isotope of oxygen with mass number 18.

Maxwell — The cgs emu magnetic flux is the flux through a cm² normal to a field at 1 cm from a unit magnetic pole.

Maxwell's rule — A law stating that every part of an electric circuit is acted upon by a force tending to move it in such a direction as to enclose the maximum amount of magnetic flux.

Mechanical equivalent of heat is the quantity of energy which, when transformed into heat, is equivalent to unit quantity of heat; 4.18×10^7 ergs = 1 calorie (20°C).

Mega — A prefix meaning million or 10^6. Symbol is M.

Meson — Two types of particles of mass intermediate between that of the electron and proton have been discovered in cosmic radiation and in the laboratory. The one particle with mass about $215m_e$ is called μ-meson, the other with about $280m_e$ π-meson. Mesons of both positive and negative charge have been found and there is now reasonably good evidence for neutral mesons. Both types of mesons decay spontaneously. Some evidence exists for a meson of mass about $1000m_e$.

Metallic elements in general are distinguished from the non-metallic elements by their luster, malleability, conductivity and usual ability to form positive ions. Nonmetallic elements are not malleable, have low conductivity and never form positive ions.

Metamagnetic Materials — Those which are antiferromagnetic in weak fields, but which become ferromagnetically ordered in strong applied fields.

Meter — The meter is the SI base unit of length and is the length equal to 1 650 763.73 wavelengths in vacuum of the radiation corresponding to the transition between the levels $2p_{10}$ and $5d_5$ of the krypton-86 atom.

Mev — Mev = million electron volts.

Micro — A prefix meaning one millionth or 10^{-6}. Symbol is μ.

Mie scattering—That which is produced by spherical particles without special regard to comparative size of radiation wavelength ad particle diameter.

Milli — A prefix meaning 1/1000 or 10^{-3}. Symbol is m.

Minimum deviation — The deviation or change of direction of light passing through a prism is a minimum when the angle of incidence is equal to the angle of emergence. If D is the angle of minimum deviation and A the angle of the prism, the index of refraction of the prism for the wave length used is,

$$n = \frac{\sin \frac{1}{2}(A + D)}{\sin \frac{1}{2}A}$$

Minute of arc — $\frac{1}{60}$ of a degree.

Mixtures consist of two or more substances intermingled with no constant percentage composition, and with each component retaining its essential original properties.

Moderator — A material used for slowing down neutrons in an atomic pile or reactor. Usually graphite or "heavy water" (deuterium oxide).

Modified index of refraction — An atmospheric index of refraction mathematically modified so that when its gradient is applied to energy propagation over a hypothetical flat earth it is substantially equivalent to propagation over the true curved earth with the actual index of refraction. Also called refractive modulus, modified refractive index. Compare potential index of refraction.

The modified index of refraction is usually expressed in M-units; mathematically

$$M = \left(n - 1 + \frac{h}{c}\right) 10^5 = N + \left(\frac{h}{a}\right) 10^6$$

where n is the index of refraction at a point in the atmosphere; h is the height above mean sea level of that point; a is the radius of the earth; and N is the index of refraction in N-units.

In ray tracing problems, the vertical gradient dM/dh can be used directly to obtain a ray path curvature that is relative to the curvature of the earth, i.e.,

$$\frac{dM}{dh} = \frac{dN}{dh} + \frac{10^5}{a} = \frac{10^6}{ka}$$

where k is a value by which the earth's radius is multiplied to get the radius of curvature of the ray path; ka is called the effective earth radius.

Modulus of elasticity — The stress required to produce unit strain, which may be a change of length (Young's modulus): a twist or shear (modulus of rigidity or modulus of torsion) or a change of volume (bulk modulus), expressed in dynes per square centimeter. Dimensions, the same as of stress, $[m\, l^{-1}\, t^{-2}]$.

Moire patterns — Pattern resulting from interference beats between two sets of periodic structures in an image.

Molal solution contains 1 mol/1000 g of solvent.

Molar conductance, Λ^m — The molar conductance of an electrolytic solution is the conductance of a solution containing 1 g mol of the solute (or electrolyte) when measured in a like manner to equivalent conductance. Seldomly used.

Molar solution contains 1 mol or g mol wt of the solute in 1 ℓ of solution.

Mole — the amount of substance of a system which contains as many elementary entities as there are atoms in 0.012 kg of carbon 12.

Note. When the mole is used, the elementary entities must be specified and may be atoms, molecules, ions, electrons, other particles, or specified groups of such particles.

Molecular volume — Volume occupied by 1 mol. Numerically equal to the molecular weight divided by the density.

---

[*] USA Editors' note: In the USA weight is the commonly used term for mass. Because of the dual use of the term weight as a quantity, this term should be avoided in technical practice. (American National Standard Z210.1)

Molecular weight — The sum of the atomic weights of all the atoms in a molecule.

Molecule — The smallest unit quantity of matter which can exist by itself and retain all the properties of the original substance.

Mol volume — The volume occupied by a mol or a gram molecular weight of any gas measured at standard conditions is 22.414 ℓ.

Moment of force or torque — The effectiveness of a force to produce rotation about an axis, measured by the product of the force and the perpendicular distance from the line of action of the force to the axis. Cgs unit—the dyne-centimeter. Dimensions, $[m\ l^2\ t^{-2}]$. If a force F acts to produce rotation about a center at a distance d from the line in which the force acts, the force has a torque,

$$L = Fd.$$

Moment of inertia — A measure of the effectiveness of mass in rotation. In the rotation of a rigid body not only the body's mass, but the distribution of the mass about the axis of rotation determines the change in the angular velocity resulting from the action of a given torque for a given time. Moment of inertia in rotation is analogous to mass (inertia) in simple translation. The cgs unit is g-cm^2. Dimensions, $[m\ l^2]$.

If m_1, m_2, m_3, etc. represent the masses of infinitely small particles of a body; r_1, r_2, r_3, etc. their respective distances from an axis of rotation, the moment of inertia about this axis will be

$$I = (m_1 r_1{}^2 + m_2 r_2{}^2 + m_3 r_3{}^2 + \ldots)$$

or

$$I = \Sigma\ (mr^2)$$

Momentum — Quantity of motion measured by the product of mass and velocity. Cgs unit, one gram-centimeter per second. Dimensions, $[m\ l\ t^{-1}]$.

A mass m moving with velocity v has a momentum,

$$M = mv$$

If a mass m has its velocity changed from v_1 to v_2 by the action of a force F for a time t,

$$mv_2 - mv_1 = Ft.$$

Monochromatic emissive power is the ratio of the energy of certain defined wave lengths radiated at definite temperatures to the energy of the same wave lengths radiated by a black body at the same temperature and under the same conditions.

Monochromatic (source) — All source radiation is exactly of the same wavelength. This is never achieved in practice even with a laser, so the term "quasi-monochromatic" is used to mean nearly of the same wavelength for all practical purposes.

Monotropic — Crystal forms one of which is always metastable with respect to the other.

Mosley's law — The frequencies of the characteristic X-rays of the elements show a strict linear relationship with the square of the atomic number.

Motion, laws of — See Newton's law of motion.

Multiple proportions, law of — If two elements form more than one compound, the weights of the first element which combine with a fixed weight of the second element are in the ratio of integers to each other.

Nano — A prefix meaning one billionth or 10^{-9}. Symbol is n.

Néel Point — The temperature at which ferrimagnetic and antiferromagnetic materials become paramagnetic.

Negatron — 1. A term used for electron when it is necessary to distinguish between (negative) electrons and positrons.

2. A four element vacuum tube which displays a negative resistance characteristic.

Nernst effect — When heat flows across the lines of magnetic force, there is observed an electromotive force in the mutually perpendicular direction.

Neutralization is a reaction in which the hydrogen ion of an acid and the hydroxyl ion of a base unite to form water, the other product being a salt.

Neutrino — An electrically neutral particle of very small (probably zero) rest mass and of spin quantum number ½. When the spin is oriented parallel to the linear momentum the particle is the antineutrino. When the spin is oriented antiparallel to the linear momentum the particle is the neutrino. Postulated by Pauli in explaining the beta decay process.

Whenever a beta (positron) particle is created in a radioactive decay so is an antineutrino (neutrino). The two particles and the parent nucleus share between them the available energy and momentum. Neutrinos and antineutrinos can penetrate amounts of matter measured in light years without appreciable attenuation. Detected by Reines and Cowan using antineutrinos from fission reactors and large scintillation detectors.

Neutron — A neutral elementary particle of mass number 1. It is believed to be a constituent particle of all nuclei of mass number greater than 1. It is unstable with respect to beta-decay, with a half life of about 12 min. It produces no detectable primary ionization in its passage through matter, but interacts with matter predominantly by collisions and to a lesser extent, magnetically. Some properties of the neutron are: rest mass, 1.00894 atomic mass unit; charge, 0; spin quantum number, ½; magnetic moment, −1.9125 nuclear Bohr magnetrons.

Neutron cross section — See cross section.

Newton (unit of force) — that force which gives to a mass of 1 kg an acceleration of 1 m/sec.

Newtonian speed of sound — An approximation to the speed of sound a in a perfect gas given by the relation

$$a^2 = p/\rho$$

where p is pressure and ϱ is density. Compare Laplacian speed of sound. See Acoustic velocity.

Newtonian telescope — A reflecting telescope in which a small plane mirror reflects the convergent beam from the objective to an eyepiece at one side of the telescope. After the second reflection the rays travel approximately perpendicular to the longitudinal axis of the telescope. See Cassegrain telescope.

Newton laws of motion — A set of three fundamental postulates forming the basis of the mechanics of rigid bodies, formulated by Newton in 1687.

The first law is concerned with the principle of inertia and states that if a body in motion is not acted upon by an external force, its momentum remains constant (law of conservation of momentum). The second law asserts that the rate of change of momentum of a body is proportional to the force acting upon the body and is in the direction of the applied force. A familiar statement of this is the equation

$$F = ma$$

where F is vector sum of the applied forces, m is the mass, and a is the vector acceleration of the body. The third law is the principle of action and reaction, stating that for every force acting upon a body there exists a corresponding force of the same magnitude exerted by the body in the opposite direction.

Newton's law of cooling — The rate of cooling of a body under given conditions is proportional to the temperature difference between the body and its surroundings.

Nodal points — Two points on the axis of a lens such that a ray entering the lens in the direction of one, leaves as if from the other and parallel to the original direction.

Noncondensable gas — A gas whose temperature is above its critical temperature, so that it cannot be liquefied by increase of pressure alone.

Normal atmosphere — This is defined as the pressure exerted by a vertical column of 76 cm of mercury of density 13.5951 g/cm^3 at a place where the gravitational acceleration is $g = 980.665$ cm/sec^2.

$$\begin{aligned} 1\ \text{atm} &= 1.013246 \times 10^6\ \text{dyn/cm}^2 \\ &= 14.696\ \text{psi} \\ &= 29.291\ \text{in of Hg at } 32^\circ\ \text{F} \\ 1\ \text{mm of Hg} &= 1\ \text{Torr} = 1333.22\ \text{dyn/cm}^2 \end{aligned}$$

Normal salt — An ionic compound containing neither replaceable hydrogen nor hydroxyl ions.

Normal solution — contains one gram molecular weight of the dissolved substance divided by the hydrogen equivalent of the substance (that is, one gram equivalent) per liter of solution.

Nuclear atom — The atom of each element consists of a small dense nucleus which includes most of the mass of the atom. The nucleus is made up of roughly equal numbers of neutrons and protons. The positive charges of the protons enables the nucleus to surround itself with a set of negatively charged electrons which move around the nucleus in complicated orbits with well defined energies. The outermost electrons which are least tightly bound to the nucleus play the dominant part in determining the physical and chemical properties of the atom. There are as many electrons in orbits as there are protons in the nucleus.

Nuclear cross section (symbol σ) — A measure of the probability that the reaction will take place which is defined by

$$dI = In\sigma\, dx$$

where I is the intensity of the particle beam; n is the number of target nuclei per cubic centimeter of target; σ is the cross section for the specified process, expressed in square centimeters; and x is the target thickness in centimeters. See barn.

Nuclear fusion — See fusion.

Nuclear isomers — Isotopes of elements having the same mass number and atomic number but differing in radioactive properties such as half-life period.

Nuclear magneton symbol M_N)—A unit of magnetic moment of the proton equal to 5.0505×10^{-24} erg per gauss.

Nucleon — Any particle found in the structure of an atom's nucleus. The most plentiful ones are neutrons and protons.

Nucleus — The dense central core of the atom, in which most of the mass and all of the positive charge is concentrated. The charge on the nucleus, an integral multiple of Z of the electronic charge, is the essential factor which distinguishes one element from another. Z is called the atomic number and gives the number of protons in the nucleus, which includes a roughly equal number of neutrons. The mass number A gives the total number of neutrons plus protons. See Isotopes and Nuclear Atom.

Nuclide — A species of atom distinguished by the constitution of its nucleus. The nuclear constitution is specified by the number of protons, Z; number of neutrons, N; and energy content. (Or, by the atomic number, Z; mass number A (= N + Z) and atomic mass).

Numerical aperture is the sine of half the angular aperture, used as a measure of the optical power of an objective.

Nusselt number (symbol N_{Nu}) — (After Wilhelm Nusselt, 1882- , German engineer.) A number expressing the ratio of convective to conductive heat transfer between a solid boundary and a moving fluid, defined as hl/k where h is the heat-transfer coefficient, l is the characteristic length, and k is the thermal conductivity of the fluid.

Objective — The lens or combination of lenses which receives light rays from an object and refracts them to form an image in the focal plane of the eyepiece of an optical instrument, such as a telescope. Also called object glass.

Object wave — The scattered or reflected wave from the object which it is desired to image or "reconstruct".

Oersted — The cgs emu of magnetic intensity exists at a point where a force of 1 dyn acts upon a unit magnetic pole at that point, i.e., the intensity 1 cm from a unit magnetic pole.

Ohm (unit of electric resistance) — The electric resistance between two points of a conductor when a constant difference of potential of 1 volt, applied between these two points, produces in this conductor a current of 1 ampere, this conductor not being the source of any electromotive force.

Ohm's law — Current in terms of electromotive force E and resistance R.

$$I - \frac{E}{R}$$

The current is given in amperes when E is in volts and R in ohms.

Optical correlation — Process of determinating the similarity of an optical signal or wave form to a reference-stored signal or wave form. The reference is usually stored as a matched filter.

Optical path length — The total phase change between the source and a given position in the energy beam as measured along the direction of travel of the beam or wavefronts.

Optical pyrometer — A device for measuring the temperature of an incandescent radiating body by comparing its brightness for a selected wavelength interval within the visible spectrum with that of a standard source; a monochromatic radiation pyrometer.

Optical thickness — Specifically, in calculations of the transfer of radiant energy, the mass of a given absorbing or emitting material lying in a vertical column of unit cross-sectional area and extending between two specific levels. Also called optical depth.

If z_1 and z_2 are the lower and upper limits, respectively, of a layer in which the variation of a density ϱ of some absorbing or emitting substance is given as a function of height z, then the quantity

$$\int_{z_1}^{z_2} \rho(z)\, dz$$

is called the optical thickness of that substance within that particular layer.

Order (of a bright fringe) — Proportional to the path difference between the two wave components producing a fringe (measured in integral numbers of wavelengths). No path difference produces zero order fringes.

Order (of a dark fringe) — Proportional to the path difference between the two wave components producing a fringe (measured as one-half the quantity of integral half wavelengths less one; i.e., path difference of 3.2 a wavelength produces a 1st order dark fringe).

Organ pipes — The frequency of vibration of a closed pipe or other air column of length l, where V is the velocity of sound in air, for the fundamental and first three overtones respectively is,

$$n_0 = \frac{V}{4l}, \qquad n_1 = \frac{3V}{4l}, \qquad n_2 = \frac{5V}{4l}, \qquad n_3 = \frac{7V}{4l}$$

For an open pip,

$$n_0 = \frac{V}{2l}, \qquad n_1 = \frac{2V}{2l}, \qquad n_2 = \frac{3V}{2l}, \qquad n_3 = \frac{4V}{2l}$$

Osmotic-pressure effect — An enhancement in the velocity of the central ion, in the direction of the applied external field, as a result of more collisions on the central ion from ions behind the central ion than from ions in front of it.

Overall heat-transfer coefficient — The value U, in British thermal units per hour per square foot per °F in the equation

$$Q = UA(t_1 - t_2)$$

where Q is heat flow per unit time; A is area; and t is temperature.

Oxidation is any process which increases the proportion of oxygen or acid-forming or radical in a compound.

Packing fraction — Packing fraction is the difference between the actual mass of the isotope and the nearest whole number divided by the mass number. Thus the packing fraction is equal to (M − A)/A where M is the actual mass and A is the mass number. For example, one of the chlorine isotopes has a mass of 32.9860. The packing fraction for this isotope is

$$\frac{32.9860 - 33.0000}{33.0000} = -0.00042$$

Packing fractions are usually expressed as parts per 10,000 and so the packing fraction for this isotope of chlorine is written as −4.2. Since oxygen is taken as the standard, elements with positive packing fractions are less stable than oxygen, those with negative packing fractions are more stable.

It is positive for nuclides with mass number less than 16 or greater than 180, and negative for most others.

Parallax — The difference in the apparent direction or position of an object when viewed from different points expressed as an angle.

For bodies of the solar system, parallax is measured from the surface of the earth and its center and is called geocentric parallax, varying with the body's altitude and distance from the earth. The geocentric parallax when a body is in the horizon is called horizontal parallax and is the angular semidiameter of the earth as seen from the body. Parallax of the moon is called lunar parallax. For stars, parallax is measured from the earth and the sun, and is called annual, heliocentric, or stellar parallax. Compare aberration

Paramagnetic materials — Those within which an applied magnetic field is slightly increased by the alignment of electron orbits. The slight diamagnetic effect in materials having magnetic dipole moments is overshadowed by this paramagnetic alignment. As the temperature increases this paramagnetism disappears leaving only diamagnetism. The permeability of paramagnetic materials is slightly greater than that of empty space.

Parsec — A unit of length equal to the distance from the sun to a point having a heliocentric parallax of 1 second (1"), used as a measure of stellar distance.

The name parsec is derived from the words parallax second. 1 parsec = pc
= 3.084×10^{13} kilometers
= 206,265 astronomical units
= 3.262 light years.

Partial pressure — The pressure exerted by a designated component or components of a gaseous mixture.

Pascal — The unit of pressure in the SI system; 1 pascal equals 1 newton per square meter.

Pascal's law — Pressure exerted at any point upon a confined liquid is transmitted undiminished in all directions.

Pauli exclusion principle — The principle that no pair of identical particles can simultaneously occupy the same quantum state. The principle applies to electrons, protons, and neutrons and accounts for the shell configurations of extranuclear electrons and for the shell structure of nuclei themselves.

Peltier effect — When a current flows across the junction of two unlike metals it gives rise to an absorption or liberation of heat. If the current flows in the same direction as the current at the hot junction in a thermoelectric circuit of the two metals, heat is absorbed; if it flows in the same direction as the current at the cold junction of the thermoelectric circuit heat is liberated.

Pendulum — For a simple pendulum of length l, for a small amplitude, the complete period,

$$T = 2\pi\sqrt{\frac{l}{g}} \qquad \text{or } g = 4\pi^2\ \frac{l}{T^2}$$

T will be given in seconds if l is in cm and g in cm per sec². For a sphere suspended by a wire of negligible mass where d is the distance from the knife edge to the center of the sphere whose radius is r, the length of the equivalent simple pendulum,

$$l = d + \frac{2r^2}{5d}$$

If the period is P for an arc θ, the time of vibration in an infinitely small arc is approximately

$$T = \frac{P}{1 + \frac{1}{4}\sin^2\frac{\theta}{4}}$$

For a compound pendulum, if a body of mass m be suspended from a point about which its moment of inertia is I with its center of gravity a distance h below the point of suspension, the period

$$T = 2\pi\sqrt{\frac{I}{mgh}}$$

Penning effect — An increase in the effective ionization rate of a gas due to the pressure of a small number of foreign metastable atoms.

For instance, a neon atom has a metastable level at 16.6 V and if there are a few neon atoms in a gas of argon which has an ionization potential of 15.7 V, a collision between the neon metastable atom with an argon atom may lead to ionization of the argon. Thus, the energy which is stored in the metastable atom can be used to increase the ionization rate. Other gases where this effect is used are helium, with a metastable level at 19.8 V, and mercury, with an ionization level at 10.4 V.

Perfect fluid — In simplifying assumptions, a fluid chiefly characterized by lack of viscosity and, usually, by incompressibility. Also called an ideal fluid, inviscid fluid. See Perfect gas.

A perfect fluid is sometimes further characterized as homogeneous and continuous.

Perfect gas — A gas which has the following characteristics: (a) it obeys the Boyle-Mariotte law and the Charles-Gay-Lussac law, thus satisfying the equation of state for perfect gases; (b) it has internal energy as a function of temperature alone; and (c) it has specific heats with values independent of temperature. Also called ideal gas. Compare perfect fluid.

The normal volume of a perfect gas is 2.24136×10^4 cm³/mol.

Perigee — That orbital point nearest the earth when the earth is the center of attraction.

Perihelion — That point in a solar orbit which is nearest the sun.

Period in uniform circular motion is the time of one complete revolution. In any oscillatory motion it is the time of a complete oscillation. Dimension, [t].

Periodic law — Elements when arranged in the order of their atomic weights or atomic numbers show regular variations in most of their physical and chemical properties.

Permeance, the reciprocal of reluctance. Unit permeance is the permeance of a cylinder one square centimeter crosssection and one centimeter length taken in a vacuum. Dimensions $[\varepsilon^{-1}\, l^{-1}\, t^2]$; $[\mu l]$.

Phase angle — The phase difference of two periodically recurring phenomena of the same frequency, expressed in angular measure.

Phase of oscillatory motion — The fraction of a whole period which has elapsed since the moving particle last passed through its middle position in a positive direction.

Phase (of wave) — The distance between the position of an amplitude crest of a wave train and a reference position measured in units of wavelength, degrees, or radians (one wavelength equals 360°, or 2π radians).

Phon — The unit of loudness level. The loudness level of a sound in phons is equal to the sound pressure level in decibels re 0.0002 microbar of a pure tone of 1000 Hz which a group of listeners judge to be equally loud.

Phosphorescence — Emission of light which continues after the exciting mechanism has ceased. See luminescence. Compare fluorescence. An example of phosphorescence is the glowing of an oscilloscope screen after the exciting beam of electrons has moved to another part of the screen.

Phot — A photometric unit of illuminance or illumination equal to 1 lumen per square centimeter. Compare footcandle, lux.

Photoelectric effect — The emission of an electron from a surface as the surface absorbs a photon of electromagnetic radiation. Electrons so emitted are termed photoelectrons.

Photoelectron — An electron which has been ejected from its parent atom by interaction between that atom and a high-energy photon.

Photographic density — The density D of silver deposit on a photographic plate or film is defined by the relation

$$D = \log O$$

where O is the opacity. If I_o and I are the incident and transmitted intensities respectively the opacity is given by I_o/I. The transparency is the reciprocal of the opacity or I/I_o.

Photometer — An instrument for measuring the intensity of light or the relative intensity of a pair of lights. Also called illuminometer.

Photon — According to the quantum theory of radiation, the elementary quantity, or quantum, of radiant energy. It is regarded as a discrete quantity having a momentum equal to hv/c, where h is Planck constance, v is the frequency of the radiation, and c is the speed of light in a vacuum. The photon is never at rest, has no electric charge and no magnetic moment, but does have a spin moment. The energy of a photon (the unit quantum of energy) is equal to hv. Photons are generated in collisions between nuclei or electrons and in any other process in which an electrically charged particle changes its momentum. Conversely photons can be absorbed (i.e., annihilated) by any charged particle.

Pico — A prefix meaning one trillionth or 10^{-12}. Symbol is p.

Piezo-electric effect — The phenomemon exhibited by certain crystals of expansion along one axis and contraction along another when subjected to an electric field. Conversely compression of certain crystals generate an electrostatic voltage across the crystal. Piezoelectricity is only possible in crystal classes which do not possess a center of symmetry.

Pinch effect — When an electric current, either direct or alternating, passes through a liquid conductor, that conductor tends to contract in cross-section, due to electromagnetic forces.

Pitch — Psychological response of the ear, primarily dependent upon the frequency of viration of the air. The intensity of the sound also has a certain effect on the pitch. Pitch of a screw is the axial distance between adjacent turns of a single thread on the screw.

Planck's constance (h) — A universal constant of nature which relates the energy of a quantum of radiation to the frequency of the oscillator which emitted it. It has the dimensions of action (energy × time). Expressed by $E = hv$ where E is the energy of the quantum and v is its frequency. Its numerical value is $6.626176\,(36) \times 10^{-27}$ erg sec.

Planck law — An expression for the variation of monochromatic radiant flux per unit area of source as a function of wavelength of black-body radiation at a given temperature; it is the most fundamental of the radiation laws. Mathematically, Planck law is

$$dw = [c_1 \lambda^{-5} / (e^{c_2}/T\lambda - 1)]\, d\lambda$$

where dw is the radiant flux from a black body in the wavelength interval dλ, centered around wavelength λ, per unit area of black-body surface at temperature T; c_1 and c_2 are radiation constants.

Planetary aberration — A displacement in the apparent position of a planet in the celestial sphere due to the relative movement of the observer and the planet. See Aberration.

Plane wave — A wave in which the wave fronts are everywhere parallel planes normal to the direction of propagation.

Plasma — An assembly of ions, electrons, neutral atoms and molecules in which the motion of the particles is dominated by electromagnetic interaction. The temperature of the collection of these particles is sufficiently high for the ionization to be above 5%. The plasma taken as a whole is electrically neutral. A plasma is further characterized by relatively large intermolecular distances, large amounts of energy stored in the internal energy of the particles and the presence of a plasma sheath at all boundaries of the plasma. Plasmas are sometimes referred to as the fourth state of matter.

Plutonium — A fissile element, artificially produced in the pile by neutron bombardment of U^{238}.

Poise — A unit of coefficient of viscosity, defined as the tangential force per unit area (dyn/cm²) required to maintain unit difference in velocity (1 cm/sec) between two parallel planes separated by 1 cm of fluid;

$$1 \text{ poise} = 1 \text{ dyne sec/cm}^2 = 1 \text{ g/cm sec.}$$

Poiseuille flow — The steady laminar flow of a fluid through a narrow horizontal circular cylinder according to the relation

$$u = (1/4\mu)\,(\partial p/\partial x)\,(a^2 - r^2)$$

where u is the fluid velocity along the cylinder's axis at a distance r from the cylinder's axis; μ is the dynamic viscosity of the fluid: a is the cylinder radius; and $\partial p/\partial x$ is the pressure gradient along the axis of the cylinder. The velocity profile across the cylinder is seen to be parabolic, and this relation affords a convenient experimental means of determining a fluid's viscosity. Also called Hagen-Poiseuille flow. Compare Couette flow.

Poisson constant (symbol μ) — The ratio of the gas constant to the specific heat of a gas at constant pressure.

Poisson distribution — A one-parameter discrete frequency distribution giving the probability that n points (or events) will be (or occur) in an interval (or time) x, provided that these points are individually independent and that the number occurring in a subinterval does not influence the number occurring in any other nonoverlapping subinterval. It has the form

$$f(n,x) = e^{-\sigma x}\,(\sigma x)^n/n!$$

The mean and variance are both σx, and σ is the average density (or rate) with which the events occur. When σx is large, the Poisson distribution approaches the normal distribution. The binomial distribution approaches the Poisson when the number of events n becomes large and the probability of success P becomes small in such a way that $nP \rightarrow \sigma x$.

Poisson's ratio is the ratio of the transverse contraction per unit dimension of a bar of uniform cross-section to its elongation per unit length, when subjected to a tensile stress.

Polarized light — Light which exhibits different directions at right angles to the line of propagation is said to be polarized. Specific rotation is the power of liquids to rotate the plane of polarization. It is stated in terms of specific rotation or the rotation in degrees per decimeter per unit density.

Polymorphism — The ability to exist in two or more crystalline forms.

Positron — A particle of the same mass M_0, as an ordinary electron. It has a positive electrical charge of exactly the same amount as that of an ordinary electron (which is sometimes called negatron). Positrons are created either by the radioactive decay of certain unstable nuclei or, together with a negatron, in a collision between an energetic (more than one Mev) photon and an electrically charged particle (or another photon). A positron does not decay spontaneously but on passing through matter it sooner or later collides with an ordinary electron and in this collision the positron-negatron pair is annihilated. The rest energy of the two particles, which is given by Einstein's relation $E = mc^2$ and amounts to 1.0216 mev altogether, is converted into electromagnetic radiation in the form of one or more photons.

Potential (electric) at any point is measured by the work necessary to bring unit positive charge from an infinite distance. Difference of potential between two points is measured by the work necessary to carry unit positive charge from one to the other. If the work involved is one erg we have the electrostatic unit of potential. Dimensions, $[\varepsilon^{-1/2}\, m^{1/2}\, l^{1/2}\, t^{-1}]$, $[\mu^{1/2}\, m^{1/2}\, l^{2/3}\, t^{-1/2}]$. The potential at a point due to a charge q at a distance r in a medium whose dielectric constant is ε is,

$$V = \frac{q}{\epsilon r}$$

Potential energy — Energy possessed by a body by virtue of its position in a gravity field in contrast with kinetic energy, that possessed by virtue of its motion.

Potential index of refraction — An atmospheric index of refraction so formulated that it would have no height variation in an adiabatic atmosphere. Also called potential refractive index. Compare modified index of refraction. The potential index of refraction is usually expressed in terms of B-units.

Pound (abbr. lb) — 1. A unit of mass equal in the U.S. to 0.45359237 kg, exactly. 2. Specifically, a unit of measurement of the thrust or force of a reaction engine representing the weight the engine can move, as an engine with 100,000 pounds of thrust. See Poundal, Pound mass. 3. The force exerted on 1 pound mass by the standard acceleration of gravity. See Gravity, sense 2.

Poundal — Force necessary to give 1 lb mass acceleration of 1 ft/sec².

Pound mass — 1. A mass equal to 0.45359237 kg. 2. A unit of measure of the inertial property equal to the mass of a body weighing 1 lb at the standard acceleration of gravity (980.665 cm/sec²).

Pound weight — A force equal to the earth's attraction for a mass of 1 lb. This force, acting on a 1 lb mass, will produce an acceleration of 32.1747 ft/sec².

Power — The time rate at which work is done. Units of power, the watt, one joule (ten million ergs) per second; the kilowatt is equal to 1000 watts; the horse-power, 33,000 foot-pounds per minute, is equal to 756 watts. Dimensions, $[m\ l^2\ t^{-3}]$. If an amount of work W is done in time t the power or rate of doing work is

$$P = \frac{W}{t}$$

Power will be obtained in watts if W is expressed in joules (10^7 ergs) and t in sec.

Power in watts for alternating current —

$$P = EI \cos \phi$$

where E and I are the effective values of the electromotive force and current in volts and amperes respectively and ϕ the phase angle between the current and the impressed electromotive force. The ratio,

$$\frac{P}{EI} = \cos \phi$$

is called the power factor.

Power developed by a direct current — The power in watts developed by an electric current flowing in a conductor, where E is the difference of potential at its terminals in volts, R its resistance in ohms, and I the current in amperes,

$$P = EI = RI^2$$

The work done in joules in a time t sec is,

$$W = EIt{:}RI^2\,t.$$

Power ratios in telephone engineering are measured in decibels. The gain or loss of power expressed in decibels is ten times the logarithm of the power ratio. By reference to an arbitrarily chosen "power level" the actual power may be expressed in decibels. The numerical values thus used will not be proportional to the actual power level but roughly to the sensation on the ear produced when the electrical power is converted into sound. A difference of 1 decibel in the power supply to a telephone receiver produces approximately the smallest change in volume of sound which a normal ear can detect.

Pressure — Force applied to, or distributed, over a surface; measured as force per unit area. Cgs unit, the barye, one dyne per square centimeter. The megabarye is equal to 10^6 dynes per square centimeter. Pressure is also measured by the height of the column of mercury or water which it supports. Dimensions, $[m\ l^{-1}\ t^{-2}]$.

The pressure due to a force F distributed over an area A,

$$P = \frac{F}{A}$$

Absolute pressure — Pressure measured with respect to zero pressure.

Gauge pressure — Pressure measured with respect to that of the atmosphere.

Primary colors — Any three colors that when mixed in suitable proportions produce any color. Primary colors may be subtractive, where the primaries absorb colors from white light (e.g., magenta, cyan, yellow; red, blue, yellow) used in developing color photography; or additive, where the primaries form a color by the addition of their light (e.g., red, green, blue).

Principal focus of a lens or spherical mirror is the point of convergence of light coming from a source at an infinite distance.

Projectiles — For bodies projected with velocity v at an angle a above the horizontal, the time to highest point of flight.

$$t = \frac{v \sin a}{g}$$

Total time of flight to reach the original horizontal plane,

$$T = \frac{2v \sin a}{g}$$

Maximum height,

$$h = \frac{v^2 \sin^2 a}{2g}$$

Horizontal range,

$$R = \frac{v^2 \sin 2a}{g}$$

In the above equations the resistance of the air is neglected, g is the acceleration due to gravity.

Prompt neutrons — In nuclear fission, those neutrons released coincident with the fission process, as opposed to the neutrons subsequently released.

Proton — A positively charged subatomic particle having a mass of 1.67252×10^{-24} g, slightly less than that of a neutron but about 1836 times greater than that of an electron.

Proton-proton reaction — A thermonuclear reaction in which two protons collide at very high velocities and combine to form a deuteron. The resultant deuteron may capture another proton to form tritium and the latter may undergo proton capture to form helium.

Proton storm — The flux of protons sent into space by a solar flare.

Pulsed laser — A laser that radiates its energy during short bursts of times (pulses) and then is inactive until the next burst or pulse. The frequency of these pulses is called the pulse repetition frequency (PRF) of the laser.

Purkinje effect — A phenomenon associated with the human eye, making it more sensitive to blue light when the illumination is poor (less than about 0.1 lumen/ft²) and to yellow light when the illumination is good.

Pyron — A unit of radiant intensity of electromagnetic radiation equal to 1 calorie/cm²/min.

Quality or timbre of sound depends on the coexistence with the fundamental of other vibrations of various frequencies and amplitudes.

Quantity of electricity or charge — The electrostatic unit of charge, the quantity which when concentrated at a point and placed at unit distance from an equal and similarly concentrated quantity, is repelled with unit force. If the distance is one centimeter and force of repulsion one dyne and the surrounding medium a vacuum, we have the electrostatic unity of quantity. The electrostatic unit of quantity may be defined as that transferred by electrostatic unit current in unit time. The quantity transferred by one ampere in one second is the coulomb, the practical unit. The faraday is the electrical charge carried by one gram equivalent. The coulomb = 3×10^9 electrostatic units. Dimensions, $[\varepsilon^{1/2}\ m^{1/2}\ l^{1/2}\ t^{-1}]$; $[\mu^{-1/2}\ m^{1/2}\ l^{1/2}]$.

Quantum — Unit quantity of energy postulated in the quantum theory. The photon is a quantum of the electromagnetic field, and in nuclear field theories, the meson is considered to be the quantum of the nuclear field.

Quantum theory — The theory first stated by Max Planck (before the Physical Society of Berlin on December 14, 1900) that all electromagnetic radiation is emitted and absorbed in quanta, each of magnitude hν, h being the Planck constant and ν the frequency of the radiation.

Quasi-monochromatic — Nearly of the same wavelength (see monochromatic).

Rad — An ionizing radiation unit corresponding to an absorption of energy in any medium of 100 ergs/g (1 rad in tissue = 100/93 rep).

Radar — A system of radio detection and ranging which detects objects by beaming rf pulses that are reflected back by the object and measures its distance by the time elapsed between transmission and reception. The strength of the echo signal is determined by the radar equation

$$W_R = W_T\ \frac{G^2 \lambda^2 \sigma}{(4\pi)^3\ R^4}$$

where W_R is received echo power. W_T is transmitted power, G is antenna gain, λ is radar carrier wavelength, σ is target cross section, and R is range.

Radar nautical mile — The time that a radar signal takes to hit a target one nautical mile away and return; 12.261 microseconds.

Radian — The angle subtended at the center of a circle by an arc equal in length to a radius of the circle. It is equal to 360°/2π or approximately 57 degrees 17 minutes 44.8 seconds. The radian is the SI unit of plane angle.

Radiation — The emission and propagation of energy through space or through a material medium in the form of waves.

The term may be extended to include streams of sub-atomic particles as alpha-rays, or beta-rays, and cosmic rays as well as electromagnetic radiation. Often used to designate the energy alone without reference to its character. In the case of light this energy is transmitted in bundles (photons).

Radiation formula, Planck's — The emission power of a black body at wave length λ may be written

$$E\lambda = \frac{c_1 \lambda^{-5}}{e^{c_2/\lambda T} - 1}$$

where c_1 and c_2 are constants with c_1 being 3.7403×10^{10} microwatts microns^4 per cm^2 or 3.7403×10^{-12} watt cm^2, c_2 being 14384 micron degrees and T the absolute temperature.

Radiation laws — 1. The four physical laws which, together, fundamentally describe the behavior of black-body radiation: (a) the Kirchoff law is essentially a thermodynamic relationship between emission and absorption of any given wavelength at a given temperature; (b) the Planck law describes the variation of intensity of black-body radiation at a given temperature, as a function of wavelength; (c) the Stefan-Boltzmann law relates the time rate of radiant energy emission from a black body to its absolute temperature; (d) the Wien law relates the wavelength of maximum intensity emitted by a black body to its absolute temperature. 2. All the more inclusive assemblage of empirical and theoretical laws describing all manifestations of radiative phenomena; e.g., Bouguer law and Lambert law.

Radioactive nuclides — Atoms that disintegrate by emission of corpuscular or electromagnetic radiations. The rays most commonly emitted are alpha or beta or gamma rays. The three classes are:

1. Primary, which have half-life times exceeding 10^8 years. These may be alpha-emitters or beta-emitters.
2. Secondary, which are formed in radioactive transformations starting with U^{238}, U^{235}, or Th^{232}.
3. Induced, having geologically short lifetimes and formed by induced nuclear reactions occurring in nature. All these reactions result in transmutation.

Radioactivity — 1. Spontaneous disintegration of atomic nuclei with emission of corpuscular or electromagnetic radiations.

2. The number of spontaneous disintegrations per unit mass and per unit time of a given unstable (radioactive) element, usually measured in curies.

Radiometer — An instrument for detecting and, usually, measuring radiant energy. Compare bolometer. See Actinometer, Photometer.

Radius of gyration may be defined as the distance from the axis of rotation at which the total mass of a body might be concentrated without changing its moment of inertia. The product of total mass and the square of the radius of gyration will give (the) moment of inertia.

Raman scattering — Raman scattering of light from a gas, liquid, or solid is that scattering in which a shift in wavelength from that of the usually monochromatic radiation occurs. The amount of shift is a function of the scattering particles and wavelengths.

Rankine cycle — An idealized thermodynamic cycle consisting of two constant-pressure processes and two isentropic processes.

Rankine scale of temperature — The Rankine scale, with its size of degree equal to that of the Fahrenheit scale, also has its zero at absolute zero of temperature. Thus, T°R = t°F + 459.67. Therefore, O°R = −459.67°F and the normal boiling point of water is 671.67°R.

Raoult's law — Molar weights of non-volatile nonelectrolytes when dissolved in a definite weight of a given solvent under the same conditions lower the solvent's freezing point, elevate its boiling point and reduces its vapor pressure equally for all such solutes.

Rayleigh number — The nondimensional ratio between the product of buoyancy forces and heat advection and the product of viscous forces and heat conduction in a fluid. It is written as

$$N_{Ra} = \frac{g\, \Delta_z T\, \alpha d^3}{\nu k}$$

where g is the acceleration of gravity; $\Delta_z T$ is a characteristic vertical temperature difference in the characteristic depth d; α is the coefficient of expansion, ν is the kinematic viscosity; and k is the thermometric conductivity.

Rayleigh scattering — This is a coherent scattering in which the intensity of the light of wavelength λ, scattered in any direction making an angle θ with the incident light, is directly proportional to $1 + \cos^2 \theta$ and inversely proportional to λ^4. The latter point is noteworthy in that it shows how much greater the scattering of the short wavelengths is. These relations apply when the scattering particles are much smaller than the wavelength of the radiation. Thus the sky is blue because blue light is scattered more than red. The unscattered light is, of course, complementary to blue, i.e., orange or yellow, which explains the "warm" hues of the sunset.

Real image — Image formed by converging rays which form a focused image in space.

Reduction is any process which increases the proportion of hydrogen or base-forming elements or radicals in a compound. Reduction is also the gaining of electrons by an atom, an ion, or an element thereby reducing the positive valence of that which gained the electron.

Reflecting telescope — A telescope which collects light by means of a concave mirror.

Reflection coefficient or reflectivity is the ratio of the light reflected from a surface to the total incident light. The coefficient may refer to diffuse or to specular reflection. In general it varies with the angle of incidence and with the wavelength of the light.

Reflection of light by a transparent medium in air (Fresnel's formulae) — If i is the angle of incidence, r the angle of refraction, n_1 the index of refraction for air (nearly equal to unity), n_2 index of refraction for a medium, then the ratio of the reflected light to the incident light is,

$$R = \tfrac{1}{2}\left(\frac{\sin^2 (i-r)}{\sin^2 (i+r)} + \frac{\tan^2 (i-r)}{\tan^2 (i+r)}\right)$$

If i = O (normal incidence), and $n_1 = 1$ (approximate for air),

$$R = \left(\frac{n_2 - 1}{n_2 + 1}\right)^2$$

Refracting telescope — A telescope which collects light by means of a lens or system of lenses. Also called refractor.

Refraction — See Index of refraction, Snell's law.

Refraction — The bending of a light or energy wave as it passes through material with varying wave velocities or indexes of refraction.

Refraction at a spherical surface — If u be the distance of a point source, v the distance of the point image or the intersection of the refracted ray with the axis, n_1 and n_2 the indices of refraction of the first and second medium, and r the radius of curvature of the separating surface,

$$\frac{n_2}{v} + \frac{n_1}{u} = \frac{n_2 - n_1}{r}$$

If the first medium is air the equation becomes,

$$\frac{n}{v} + \frac{1}{u} = \frac{n \quad 1}{r}$$

Refractivity — 1. The algebraic difference between an index of refraction and unity.

For the atmosphere, refractivity may be more conveniently expressed in N-units:

$$N = (n - 1)\, 10^5$$

The deviation of the refractivity at any altitude from the usual standard profile is expressed in B-units (for radio frequencies up to 20 kilomegacycles):

$$B = N + 0.012h$$

where h is altitude in feet.

The deviation of the refractivity at any altitude from the gradient at which the refraction curvature of a tangential ray will match the curvature of the earth may be expressed in M-units:

$$M = N + 0.048h$$

where 0.048 is 10^6 divided by the radius of the earth in feet.

Relative biological effectiveness (RBE) — The biological effectiveness of any type of energy of ionizing radiation in producing a specific damage (e.g., leukemia, anemia, sterility, carcinogenesis, catasacts, shortening of life span, etc.).

Relative humidity — The ratio of the quantity of water vapor present in the atmosphere to the quantity which would saturate at the existing temperature. It is also the ratio of the pressure of water vapor present to the pressure of saturated water vapor at the same temperature.

Relativistic mass equation — The equation

$$m = m_0\ [1 - (v^2/c^2)]^{-1/2} = m_0/(1 - \beta^2)^{1/2}$$

where $\beta \equiv v/c$ for the relativistic mass m of a particle or body of rest mass m_o when its velocity is v. See Relativistic velocity.

Relativistic particle — A particle with a velocity so large that its relativistic mass exceeds its rest mass by an amount which is significant for the computation or other considerations at hand. See Relativistic velocity.

Relativistic velocity — A velocity sufficiently high that some properties of a particle of this velocity have values significantly different from those obtaining when the particle is at rest. See Rest mass.

The property of most interest is the mass. For many purposes, the velocity is relativistic when it exceeds about one tenth the velocity of light.

Relaxation-field effect — The delay in the ion atmosphere in maintaining its symmetry around a central ion as the central ion moves in the forward direction under an applied electrical field (potential gradient).

Reluctance is that property of a magnetic circuit which determines the total magnetic flux in the circuit when a given magnetomotive force is applied. Unit, the reluctance of one centimeter length and one square centimeter cross-section of space taken in a vacuum. Dimensions, $[\varepsilon l\, t^{-2}]$; $[\mu^{-1}\, l^{-1}]$.

Reluctivity or specific reluctance is the reciprocal of magnetic permeability. The reluctivity of empty space is taken as unity. Dimensions, $[\varepsilon l^2\, t^{-2}]$; $[\mu^{-1}]$.

Rem — Abbreviation for roentgen-equivalent-man.

Resistance is a property of conductors depending on their dimensions, material and temperature which determines the current produced by a given difference of potential. The practical unit of resistance, the ohm is that resistance through which a difference of potential of one volt will produce a current of one ampere. The international ohm is the resistance offered to an unvarying current by a column of mercury at 0°C; 14,4521 in mass, of constant cross-sectional area and 106.300 cm in length, sometimes called the legal ohm. Dimensions, $[\varepsilon^{-1}\, l^{-1}\, t]$; $[\mu l\, t^{-1}]$.

Resistance of a conductor at 0°C, of length l, cross-section s and specific resistance ϱ

$$R_o = \rho \frac{l}{s}$$

The resistivity may be expressed as ohm-cm when R is in ohms, l in cm and s in cm².

Resistance of a conductor at a temperature t whose resistance at 0°C is R_o and whose temperature resistance coefficient is α

$$R_t = R_o(1 + \alpha t)$$

Resistance of conductors in series and parallel — The total resistance of any number of resistances joined in series is the sum of the separate resistances. The total resistance of conductors in parallel whose separate resistances are r_1, r_2, $r_3 \cdots r_n$ is given by the formula

$$\frac{1}{R} = \frac{1}{r_1} + \frac{1}{r_2} + \frac{1}{r_3} \ldots + \frac{1}{r_n}$$

Where R is the total resistance. For two terms this becomes,

$$R = \frac{r_1 r_2}{r_1 + r_2}$$

Resistance, specific (Resistivity) — A proportionality factor characteristic of different substances equal to the resistance that a centimeter cube of the substance offers to the passage of electricity, the current being perpendicular to two parallel faces. It is defined by the expression:

$$R = \rho \frac{l}{A}$$

where R is the resistance of a uniform conductor, l is its length, A is its cross sectional area, and ϱ is its resistivity. Resistivity is usually expressed in ohm-centimeters.

Resistivity (symbol ϱ) — In electricity, a characteristic proportionality factor equal to the resistance of a centimeter cube of a substance to the passage of an electric current perpendicular to two parallel faces. Also called specific resistance.

$$R = \rho(l/A)$$

where R is the resistance of a uniform conductor, l is its length, A is its cross-sectional area, and ϱ is its resistivity.

Resolving power of a telescope or microscope is indicated by the minimum separation of two objects for which they appear distinct and separate when viewed through the instrument.

Resonance — 1. The phenomenon of amplification of a free wave or oscillation of a system by a forced wave or oscillation of exactly equal period. The forced wave may arise from an impressed force upon the system or from a boundary condition. The growth of the resonant amplitude is characteristically linear in time. 2. Of a system in forced oscillation, the condition which exists when any change, however small, in the frequency of excitation causes a decrease in the response of the system.

Resonance (chemical) — The moving of electrons from one atom of a molecule or ion to another atom of that molecule or ion. It is simply the oriented movement of the bonds between atoms.

Restitution, coefficient of, for two bodies on impact. The ratio of the difference in velocity, after impact to the difference before impact.

Rest mass — According to relativistic theory, the mass which a body has when it is at absolute rest. Mass increases when the body is in motion according to

$$m = m_0/\sqrt{1 - (v^2/c^2)}$$

where m is its mass in motion, m_o is its rest mass; v is the body's speed of motion, and c is the speed of light.

Newtonian physics, in contrast with relativistic physics, makes no distinction between rest mass and mass in general.

Reverberation — 1. The persistence of sound in an enclosed space, as a result of multiple reflections after the sound source has stopped. 2. The sound that persists in an enclosed space, as a result of repeated reflection or scattering, after the source of the sound has stopped.

Reversible reaction — One which can be caused to proceed in either direction by suitable variation in the conditions of temperature, volume, pressure or of the quantities of reacting substances.

Rochon prism — A birefringent electro-optical crystal which divides incident unpolarized optical beam into two polarized components.

Roentgen (R) — That quantity of X or gamma radiation such that the associated corpuscular emission per 0.001293 g of dry air (equals 1 cc at 0°C and 760 mm Hg) produces, in air, ions carrying 1 esu of quantity of electricity of either sign.

Roentgen equivalent man (REM) — That amount of ionizing radiation of any type which produces the same damage to man as 1 roentgen of about 200-kv X radiation (1 rem = 1 rad in tissue/RBE). It should be noted that, when the physical dose is measured in rep units, the approximate definition is used: 1 rem ≈ 1 rep/RBE.

Roentgen equivalent physical (REP) — That amount of ionizing radiation of any type which results in the absorpion of energy at the point in question in soft tissue to the extent of 93 ergs/g. It is approximately equal to 1 roentgen of about 200-kv X radiation in soft tissue.

Root-mean-square error (symbol σ). In statistics, the square root of the arithmetic mean of the squares of the deviations of the various items from the arithmetic mean of the whole. Also termed standard deviation.

Rotatory power is the power of rotating the plane of polarized light, given in general by θ/l where θ is the total rotation which occurs in a distance l.

The molecular or atomic rotatory power is the product of the specific rotatory power by the molecular or atomic weight. Magnetic rotatory power is given by

$$\theta/e\ H \cos \alpha$$

where H the intensity of the magnetic field, and α the angle between the field and the direction of the light.

Rydberg formula — A formula, similar to that of Balmer, for expressing the wave-numbers (v) of the lines in a spectral series:

$$V = R \left[\frac{1}{(n + a)^2} - \frac{1}{(m + b)^2} \right]$$

where n and m are integers and m > n, a and b are constants for a particular series, and R is the Rydberg constant, 109737.3 cm^{-1} for hydrogen.

Salt — Any substance which yields ions, other than hydrogen or hydroxyl ions. A salt is obtained by displacing the hydrogen of an acid by a metal.

Scale height (symbol h, h_s) — A measure of the relationship between density and temperature at any point in an atmosphere; the thickness of a homogeneous atmosphere which would give the observed temperature:

$$h = kT/mg = R^*T/Mg$$

where k is the Boltzmann constant; T is the absolute temperature; m and M are the mean molecular mass and weight, respectively, of the layer; g is the acceleration of gravity; and R* is the universal gas constant. Compare virtual height.

Scattered (light) — Reflection of light from a surface in all directions in a nonuniform manner.

Scattering Coefficient — A measure of the attenuation due to scattering of radiation as it traverses a medium containing scattering particles. Also called total scattering coefficient.

Scattering cross section — The hypothetical area normal to the incident radiation that would geometrically intercept the total amount of radiation actually scattered by a scattering particle. It is also defined, equivalently, as the cross-section area of an isotropic scatterer (a sphere) which would scatter the same amount of radiation as the actual amount. Also called extinction cross section, effective area.

Schlieren (photography) — A picture or image in which density gradients in a volume of flow are made visible. The image is produced by refraction and scattering from regions of changing refractive index.

Scintillation counter — The combination of phosphor, photomultiplier tube, and associated circuits for counting scintillations. Also called scintillating counter.

Scintillometer — An instrument which detects radiation by emitting flashes of light.

Second — The second is the unit of time of the International System of Units. The definition adopted at the October 13, 1967 meeting of the 13th General Conference on Weights and Measures is: "The second is the duration of 9,192,631,770 periods of the radiation corresponding to the transition between the two hyperfine levels of the fundamental state of the atom of cesium 133." The frequency (9,192,631,770 Hz) which the definition assigns to the cesium radiation was carefully chosen to make it impossible, by any existing experimental evidence, to distinguish the new second from the "ephemeris second" based on the earth's motion. Therefore no changes need to be made in data stated in terms of the old standard in order to convert them to the new one. The atomic definition has two important advantages over the previous definition: (1) it can be realized (i.e., generated by a suitable clock) with sufficient precision, ± 1 part per hundred billion (10^{11}) or better, to meet the most exacting demands of modern metrology; and (2) it is available to anyone who has access to or who can build an atomic clock controlled by the specified cesium radiation. (A description of such clocks is given in "Atomic Frequency Standards," NBS Tech. News Bull. 45, 8—11 (Jan., 1961). For more recent developments and technical details, see R. E. Beehler, R. C. Mockler, and J. M. Richardson, "Cesium Beam Atomic Time and Frequency Standards," Metrologia 1, 114—131 (July, 1965)). In addition one can compare other high-precision clocks directly with such a standard in a relatively short time — an hour or so compared against years with the astronomical standard. Laboratory-type atomic clocks are complex and expensive, so that most clocks and frequency generators will continue to be calibrated against a standard such as the NBS Frequency Standard, controlled by a cesium atomic beam, at the Radio Standards Laboratory in Boulder, Colorado. In most cases the comparison will be by way of the standard-frequency and time-interval signals broadcast by NBS radio stations WWV, WWVH, WWVB, and WWVL.

Second law of thermodynamics — An inequality asserting that it is impossible to transfer heat from a colder to a warmer system without the occurrence of other simultaneous changes in the two systems or in the environment.

It follows from this law that during an adiabatic process, entropy cannot decrease. For reversible adiabetic processes entropy remains constant, and for irreversible adiabatic processes it increases.

Another equivalent formulation of the law is that it is impossible to convert the heat of a system into work without the occurrence of other simultaneous changes in the system or its environment. This version, which requires an engine to have a cold source as well as a heat source, is particularly useful in engineering applications. See first law of thermodynamics.

Second of arc — 1/60 of a minute of arc.

Seebeck effect — If a circuit consists of two metals, one junction hotter than the other, a current flows in the circuit. The direction of the flow depends on the metals and the temperature of the junctions.

Semiconductor — An electronic conductor, with resistivity in the range between metals and insulators, in which the electrical charge carrier concentration increases with increasing temperature over some temperature range. Certain semiconductors possess two types of carriers, namely, negative electrons and positive holes.

Sensitiveness of a balance — Assuming the three knife edges of a balance to lie on a straight line; if M is the weight of the beam, h the distance of the center of gravity below the knife edge, L the length of the balance arms and m a small mass added to one pan, the deflection θ produced is given by

$$\tan \theta = \frac{mL}{Mh}$$

Shear strength — "The stress, usually expressed in pounds per square inch, required to produce fracture when impressed perpendicularly upon the cross-section of a material."

Shell — According to Pauli's exclusion principle (q.v.), the extranuclear electrons do not circle around the nucleus all in orbits of the same radius, but are arranged in orbits at various distances from the nucleus. The extranuclear orbital electrons are thus assumed to be arranged in a series of concentric spheres, called shells, which are designated, in the order of increasing distance from the nucleus, as K, L, M, N, O, P, and Q shells. The number of the electrons which each of these shells can contain is limited. All electrons arranged in the same shell have the same principal quantum number. The electrons in the same shell are grouped into various subshells (q.v.), and all the electrons in the same subshell have the same orbital angular momentum. See Subshell.

Sidereal day. The duration of one rotation of the earth on its axis, with respect to the vernal equinox. It is measured by successive transits of the vernal equinox over the upper branch of a meridian.

Because of the precession of the equinoxes, the sidereal day thus defined is slightly less than the period of rotation with respect to the stars, but the difference is less than 0.01 sec. The length of the mean sidereal day is 24 hr of sidereal time or 23 hr 56 min 4.09054 sec of mean solar time.

Sidereal month — The average period of revolution of the moon with respect to the stars, a period of 27 days 7 hr 43 min 11.5 sec, or approximately 27⅓ days.

Sidereal time — Time based upon the rotation of the earth relative to the vernal equinox.

Sidereal time may be designated as local or Greenwich as the local or Greenwich meridian is used as the reference. When adjusted for nutation, to eliminate slight irregularities in the rate, it is called mean sidereal time.

Sidereal year — The period of one apparent revolution of the earth around the sun, with respect to the stars, averaging 365 days 6 hr 9 min 9.55 sec in 1955, and increasing at the rate of 0.000095 sec annually.

Because of the precession of the equinoxes this is about 20 min longer than a tropical year.

Simple harmonic motion — Periodic oscillatory motion in a straight line in which the restoring force is proportional to the displacement. If a point moves uniformly in a circle, the motion of its projection on the diameter (or any straight line in the same plane) is simple harmonic motion.

If r is the radius of the reference circle, ω the angular velocity of the point in the circle, θ the angular displacement at the time t after the particle passes the midpoint of its path, the linear displacement,

$$x = r \sin \theta = r \sin \omega t$$

The velocity at the same instant,

$$v = r\omega \cos \theta = \omega\sqrt{r^2 - x^2}$$

The acceleration,

$$a = -\omega^2 x.$$

The force for a mass m,

$$F = m\omega^2 x = -\frac{4\pi^2 m x}{T^2}$$

The period,

$$T = 2\pi\sqrt{\frac{x}{a}}$$

In the above equations the cgs system calls for x and r in centimeters, v in centimeters per second, a in centimeters per second squared, T in seconds, M in grams, F in dynes, θ in radians and ω in radians per second.

Simple machine — A contrivance for the transfer of energy and for increased convenience in the performance of work.

Mechanical advantage is the ratio of the resistance overcome to the force applied. Velocity ratio is the ratio of the distance through which force is applied to the distance through which resistance is overcome.

Efficiency is the ratio of the work done by a machine to the work done upon it.

If a force f applied to a machine through a distance S results in a force F exerted by the machine through a distance s, neglecting friction,

$$fS = Fs$$

The theoretical mechanical advantage or velocity ratio in the above case is,

$$\frac{S}{s}$$

Actually, the force obtained from the machine will have a smaller value than will satisfy the equation above. If F′ be the actual force obtained, the practical mechanical advantage will be,

$$\frac{F'}{f}$$

The efficiency of the machine,

$$E = \frac{F's}{fS}$$

Snell's law of refraction — If i is the angle of incidence, r the angle of refraction, v the velocity of light in the first medium, v′ the velocity in the second medium, the index of refraction n,

$$n = \frac{\sin i}{\sin r} = \frac{V}{V'}$$

Solar constant — The rate at which solar radiation is received outside the earth's atmosphere on a surface normal to the incident radiation and at the earth's mean distance from the sun.

Measurements of solar radiation at the earth's surface by the Smithsonian Institution for several decades give a best value for the solar constant of 1.934 calories per square centimeter per minute. Measurements from rockets of the intensity of the ultraviolet end of the spectrum have corrected this value to 2.00 calories per square centimeter per minute with a probable error of ± 2%.

Solar wind — Streams of plasma flowing approximately radially outward from the sun.

Solid — A state of matter in which the relative motion of the molecules is restricted and they tend to retain a definite fixed position relative to each other, giving rise to crystal structure. A solid may be said to have a definite shape and volume.

Solid angle — Measured by the ratio of the surface of the portion of a sphere enclosed by the conical surface forming the angle, to the square of the radius of the sphere. Unit of solid angle, the steradian, the solid angle which encloses a surface on the sphere equivalent to the square of the radius. Dimensions, unity.

Solubility of one liquid or solid in another is the mass of a substance contained in a solution which is in equilibrium with an excess of the substance. Under these conditions the solution is said to be saturated. Solubility of a gas is the ratio of concentration of gas in the solution to the concentration of gas above the solution.

Solubility product or precipitation value is the product of the concentration of the ions of a substance in a saturated solution of the substance. These concentrations are frequently expressed as moles of solute per liter of solution.

Solute — That constituent of a solution which is considered to be dissolved in the other, the solvent. The solvent is usually present in larger amount than the solute.

A solution is saturated if it contains at given temperature as much of a solute as it can retain in the presence of an excess of that solute.

A true solution is a mixture, liquid, solid or gaseous, in which the components are uniformly distributed throughout the mixture. The proportion of the constituents may be varied within certain limits.

Solvent — That constituent of a solution which is present in larger amount; or, the constituent which is liquid in the pure state, in the case of solutions or solids or gases in liquids.

Sone — A unit of loudness. A simple tone of frequency 1000 cycles/sec, 40 decibels above a listener's threshold, produces a loudness of 1 sone.

Spatial frequency plane — The focusing plane of an optical lens or system where the image represents the spatial Fourier transform of the object spatial function.

Specific conductance, σ_{sp} — The specific conductance, or conductivity, of a conductor of electricity is the conductance of the material between opposite sides of a cube, 1 cm in each direction. The unit of specific conductance is $ohm^{-1}\ cm^{-1}$ or $mho\ cm^{-1}$.

Specific gravity — The ratio of the mass of a body to the mass of an equal volume of water at 4°C or other specified temperature. Dimensions, unity.

Specific heat of a substance is the ratio of its thermal capacity to that of water at 15°C. Dimensions, unity.

If a quantity of heat H calories is necessary to raise the temperature of m grams of a substance from t_1 to t_2°C, the specific heat, or more properly, thermal capacity of the substance,

$$s = \frac{H}{m(t_2 - t_1)}$$

Specific heat by the method of mixtures— Where a mass m_1 of the substance is heated to a temperature t_1, then placed in a mass of water m_2 t a temperature t_2 contained in a calorimeter with stirrer (of same material) of mass m_3, specific heat of the calorimeter c, t_3 the final temperature

$$m_1 s(t_1 - t_3) = (m_3 c + m_2)(t_3 - t_2)$$

Black's ice calorimeter — If a body of mass m and temperature t melts a mass m′ of ice, its temperature being reduced to 0°C, the specific heat of the substance is,

$$s = \frac{80.1\ m'}{mt}$$

Bunsen's ice calorimeter — A body of mass m at temperature t causes a motion of the mercury column of l centimeters in a tube whose volume per unit length is v. The specific heat is

$$s = \frac{884lv}{mt}$$

Specific inductive capacity — The ratio of the capacitance of a condenser with a given substance as dielectric to the capacitance of the same condenser with air or a vacuum as dielectric is called the specific inductive capacity. The ratio of the dielectric constant of a substance to that of a vacuum.

Specific rotation — If there are n grams of active substance in v cubic centimeters of solution and the light passes through l decimeters, r being the observed rotation in degrees, the specific rotation (for 1 centimeter),

$$[\alpha] = \frac{rv}{nl}$$

Specific volume is the reciprocal of density. Dimensions, $[m^{-1}\, l^3]$.

Spectral series are spectral lines or groups of lines which occur in an orderly sequence.

Specular reflection — Mirror scattering at one angle from the point of reflection.

Speed — Time rate of motion measured by the distance moved over in unit time. Cgs unit, 1 cm/sec. Dimension $[l\, t^{-1}]$.

Speed of sound (symbol c_s) — The speed of propagation of sound waves. In the atmosphere

$$c_t = [\gamma (R^*/M_0)\, T_M]^{1/2}$$

where γ is the ratio of specific heat of air at constant pressure to that a constant volume, R^* is the universal gas constant, M_0 is the mean molecular weight of air at sea level, and T_M is the molecular scale temperature.

At sea level in the standard atmosphere, the speed of sound is 340.294 meters per second (1116.45 ft/sec).

The concept of the speed of sound in the atmosphere loses its applicability at about 90 km where the mean free path of air molecules approaches the wavelengths of sound waves.

Spherical aberration — When large surfaces of spherical mirrors or lenses are used the light divergent from a point source is not exactly focused at a point. The phenomenon is known as spherical aberration. For axial pencils the error is known as axial spherical aberration; for oblique pencils, coma.

Spherical mirrors — If R is the radius of curvature, F principal focus, and f_1 and f_2 any two conjugate focal distances,

$$\frac{1}{f_1} + \frac{1}{f_2} = \frac{1}{F} = \frac{2}{R}$$

If the linear dimensions of the object and image be O and I respectively and u and v their distances from the mirror,

$$\frac{O}{I} = \frac{u}{v}$$

Spin — In nuclear physics, used to describe the angular momentum of elementary particles or of nuclei.

Spontaneous-ignition temperature — In testing fuels, the lowest temperature of a plate or other solid surface adequate to cause ignition in air of a fuel upon the surface.

Stagnation pressure — 1. The pressure at a stagnation point. 2. In compressible flow, the pressure exhibited by a moving gas or liquid brought to zero velocity by an isentropic process. 3. Equals total pressure. 4. Equals impact pressure.

Because of the lack of a standard meaning, stagnation pressure should be defined when it is used.

Standard conditions for gases — Measured volumes of gases are quite generally recalculated to 0°C temperature and 760 mm pressure, which have been arbitrarily chosen as standard conditions.

Stark effect — The splitting of a single spectrum line into multiple lines which occurs when the emitting material is placed in a strong electric field. The observed effect depends on the angle between the direction of the field and the direction of observation. The effect is due to the shifting of the energy states of certain orbits which all have the same energy in zero field.

Statcoulomb — The unit of electric charge in the metric system. 3×10^9 statcoulombs = 1 coulomb.

Static pressure (symbol p) — 1. The pressure with respect to a stationary surface tangent to the mass-flow velocity vector. 2. The pressure with respect to a surface at rest in relation to the surrounding fluid.

Stationary or standing waves are produced in a medium by the simultaneous transmission, in opposite directions of two similar wave motions. Fixed points of minimum amplitude are called nodes. A segment extends from one node to the next. An antinode or loop is the point of maximum amplitude between two nodes.

Statute mile — 5280 feet = 1.6093 kilometers = 0.869 nautical mile. Also called land mile.

Stefan-Boltzmann constant (symbol σ) — A universal constant of proportionality between the radiant emittance of a black body and the fourth power of the body's absolute temperature; 5.6697×10^{-5} erg per centimeter squared second $°K^4$.

Stefan-Boltzmann law — A law stating that the total radiation E from a black body is given by

$$E = \sigma T^4$$

where T is the absolute temperature of the body and σ is the Stefan-Boltzmann constant, equal to 5.672×10^{-5} erg/sec cm² deg⁴.

Steradian — The steradian is the SI unit of solid angle.

The steradian is the solid angle which, having its vertex in the center of a sphere, cuts off an area of the surface of the sphere equal to that of a square with sides of length equal to the radius of the sphere. There are 4π steradians in a sphere.

Stereoscopic image — An image which appears as a three-dimensional object located in space.

Stoichiometric — Pertaining to weight relations in chemical reactions.

Stoke — See under Viscosity.

Stokes' law — 1. Gives the rate of fall of a small sphere in a viscous fluid. When a small sphere falls under the action of gravity through a viscous medium it ultimately acquires a constant velocity,

$$V = \frac{2ga^2(d_1 - d_2)}{9\eta}$$

where a is the radius of the sphere, d_1 and d_2 the densities of the sphere and the medium respectively, and η the coefficient of viscosity. V will be in cm per sec if g is in cm per sec², a in cm, d_1 and d_2 in g per cm³ and η in dyne-sec per cm² or poises.

2. The empirical law stating that the wavelength of light emitted by a flu-

orescent material is longer than that of the radiation used to excite the fluorescence. In modern language the emitted photons carry off less energy than is brought in by the exciting photons; the details accord with the energy conservation principle.

Strain — The deformation resulting from a stress measured by the ratio of the change to the total value of the dimension in which the change occurred. Dimensions, unity.

Stress — The force producing or tending to produce deformation in a body measured by the force applied per unit area Cgs units, one dyne per square centimeter. Dimensions, $[m\, l^{-1}\, t^{-2}]$.

Subshell — The electrons within the same shell (energy level) of the atom are characterized by the same principal quantum number (n), and are further divided into groups according to the value of their azimuthal quantum numbers (l); the electrons which possess the same azimuthal quantum number for the same principal quantum number are considered to occupy the same subshell (or sublevel). The individual subshells are designated with the letters s, p, d, f, g, and h, as follows:

l value	designation of subshell
0	s
1	p
2	d
3	f
4	g
5	h

An electron assigned to the s-subshell is called an s-electron, one assigned to the p-subshell is referred to as a p-electron, etc. In formulae of electron structure, the value of the principal quantum number (n) is prefixed to the letter indicating the azimuthal quantum number (l) of the electron; thus, e.g., a 4f-electron is an electron which has the principal quantum number 4 (i.e., assigned to the N-shell) and the orbital angular momentum 3 (f-subshell).

Substance, amount of — See Mole.

Supersonic flow — In aerodynamics, flow of a fluid over a body at speeds greater than the acoustic velocity and in which the shock waves start at the surface of the body. Compare hypersonic flow.

Surface density of electricity — Quantity of electricity per unit area. Dimensions, $[\varepsilon^{1/2}\, m^{1/2}\, l^{-1/2}\, t^{-1}]$; $[\mu^{-1/2}\, m^{1/2}\, l^{-1/2}]$.

Surface density of magnetism — Quantity of magnetism per unit area. Dimensions, $[\varepsilon^{-1}\, m^{1/2}\, l^{-1/2}]$, $[\mu^{1/2}\, m^{1/2}\, l^{-1/2}\, t^{-1}]$.

Surface tension — Two fluids in contact exhibit phenomena, due to molecular attractions which appear to arise from a tension in he surface of separation. It may be expressed as dynes per centimeter or as ergs per square centimeter. Dimensions, $[m\, t^{-2}]$.

The total force along a line of length l on the surface of a liquid whose surface tension is T,

$$F = lT.$$

Capillary tubes — If a liquid of density d rises a height h in a tube of internal radius r the surface tension is,

$$T = \frac{rhdg}{2}$$

The tension will be in dynes per cm if r and h are in cm, d in g per cm³ and g in cm per sec².

Drops and bubbles — Pressure in dynes per cm² due to surface tension on a drop of radius r centimeter for a liquid whose surface tension is T dynes per centimeter,

$$P = \frac{2T}{r}$$

For a bubble of mean radius r cm,

$$P = \frac{4T}{r}$$

Susceptibility (magnetic) is measured by the ratio of the intensity of magnetization produced in a substance to the magnetizing force or intensity of field to which it is subjected. The susceptibility of a substance will be unity when unit intensity of magnetization is produced by a field of one gauss. Dimensions, $[\varepsilon^{-1}\, l^{-2}\, t^{2}]$, $[\mu]$.

"Synthetic" aperture" sidelooking radar — A sidelooking radar that generates very high resolution data by integrating its return signals during the time that the physical aircraft antenna or aperture is traveling through a large distance (making up the synthetic aperture).

Tangent galvanometer — A tangent galvanometer with n turns, of radius r, in the earth's field H, has a deflection θ. The current flowing is,

$$i = \frac{Hr}{2\pi n} \tan\theta$$

If $2\pi n = G$ (the galvanometer constant).

$$i = \frac{H}{G} \tan\theta$$

Tektite — Small glassy bodies containing no crystals, composed of at least 65% silicon dioxide, bearing no relation to the geological formations in which they occur, and believed to be of extraterrestrial origin.

Tektites are found in certain large areas called strewn fields. They are named, as are minerals, with the suffix ite, as australite, found in Australia, billitonite, indochinite, and rizalite, found in Southeast Asia, bediasite from Texas, and moldavite from Bohemia and Moravia.

Temperature may be defined as the condition of a body which determines the transfer of heat to or from other bodies. Particularly it is a manifestation of the average translational kinetic energy of the molecules of a substance due to heat agitation. The customary unit of temperature is the Centigrade degree, 1/100 the difference between the temperature of melting ice and that of water boiling under standard atmospheric pressure. Celsius scale — the Celsius temperature scale is a designation of the scale also known as the centigrade scale. The degree Fahrenheit is 1/180, and the degree Reaumur 1/80 the same difference of temperature.

The fundamental temperature cale is the absolute, thermodynamic or Kelvin scale in which the temperature measure is based on the average kinetic energy per molecule of a perfect gas. The zero of the Kelvin scale is −273.15°C. The temperature scale adopted by the International Bureau of Weights and Measures is that of the constant volume hydrogen gas thermometer. The magnitude of the degree in both these scales is defined as 1/100 the difference between the temperature of melting ice and that of boiling water at 760 mm pressure. Frequently the Kelvin scale is defined as degrees C + 273.15 and the Rankine scale as degrees F + 459.67°F.

The fundamental temperature scale is now defined by means of the equation

$$\theta(X) = 273.15^\circ K \, \frac{X}{X_3}$$

where θ denotes the temperature; X the thermometric property (P, V, ...); the subscript 3 refers to the triple point of water; and 273.16°K is the arbitrary fixed point for the temperature associated with the triple point of water.

The ideal gas temperature θ, (numerically equal to the Kelvin temperature), in particular, is defined by either of the two equations:

$$\theta = \begin{cases} 273.15^\circ \lim\limits_{P_3 \to 0} \dfrac{P}{P_3}, \text{ const. V} \\[2ex] 273.15^\circ \lim\limits_{P \to 0} \dfrac{V}{V_3}. \text{ const. P} \end{cases}$$

Temperature resistance coefficient — The ratio of the change of resistance in a wire due to a change of temperature of 1°C to its resistance at 0°C. Dimension, $[\theta{-}1]$.

Tera — A prefix meaning trillion or 10^{12}. Symbol is T.

Terrestrial radiation — 1. The total infrared radiation emitted from the earth's surface; to be carefully distinguished from effective terrestrial radiation, atmospheric radiation (which is sometimes erroneously used as a synonym for terrestrial radiation), and insolation. Also called earth radiation, eradiation.

Thermal capacity of a substance is the quantity of heat necessary to produce unit change of temperature in unit mass. It is ordinarily expressed as calories per gram per degree Centigrade. Numerically equivalent to specific heat.

Thermal capacity or water equivalent — The total quantity of heat necessary to raise any body or system unit temperature, measured as calories per degree centigrade in the cgs system. Dimension, [m].

Thermal expansion — The coefficient of linear expansion or expansivity is the ratio of the change in length per degree C to the length at 0°C. The coefficient of volume expansion (for solids) is approximately three times the linear coefficient. The coefficient of volume expansion for liquids is the ratio of the change in volume per degree to the volume at 0°C. The value of the coefficient varies with temperature. The coefficient of volume expansion for a gas under constant pressure is nearly the same for all gases and temperatures and is equal to 0.00367 for 1°C. Dimension, $[\theta^{-1}]$.

If l_o is the length at 0°C, α the coefficient of linear expansion, the length at t°C is,

$$l_t = l_0(1 + \alpha t)$$

General formula for thermal expansion — The rate of thermal expansion varies with the temperature. The genral equation giving the magnitude m, (length or volume) at a temperature t, where m_o is the magnitude at 0° C, is

$$m_t = m_0(1 + \alpha t + \beta t^2 + \gamma t^3 \ \ldots)$$

where α, β, γ, etc. are empirically determined coefficients.

Volume expansion — If V represents volume and β the coefficient of expansion,

$$V_t = V_0(1 + \beta t).$$

For solids,

$$\beta = 3\alpha \text{ (approximately).}$$

Thermal neutrons — Neutrons slowed down by a moderator to an energy of a fraction of an electron volt — about 0.025 ev. at 15°.

Thermionic emission — The emission of ions or electrons from a metal as the result of heating. The thermionic current density, J, in amperes/cm² is equal to $AT_2e^{-\phi/kT}$ where A is a constant, T is degrees Kelvin, k is Boltzmann's constant, and ϕ is the work function of the emitter.

Thermodynamic efficiency — In thermodynamics, the ratio of the work done by a heat engine to the total heat supplied by the heat source. Also called thermal efficiency, Carnot efficiency.

Thermodynamic probability — Under specified conditions, the number of equally likely states in which a substance may exist. The thermodynamic probability P is related to the entropy S by

$$S = k \ln P$$

where k is Boltzmann constant. See Third law of thermodynamics.

Thermodynamic temperature scale — The Kelvin thermodynamic scale is recognized as the fundamental scale to which all temperatures should ultimately be referable. The kelvin, unit of thermodynamic temperature, is the fraction 1/273.16 of the thermodynamic temperature of the triple point of water. The unit kelvin and its symbol K are used to express an interval or a difference of temperature. In addition to the thermodynamic temperature (symbol T), expressed in kelvins, use is also made of Celsius temperature (symbol t) defined by the equation

$$t = T - T_0$$

where T_o = 273.15 K by definition. The unit "degree Celsius" is equal to the unit "kelvin", but "degree Celsius" is a special name in place of "kelvin" for expressing Celsius temperature. A temperature interval or a Celsius temperature difference can be expressed in degrees Celsius as well as in kelvins.

Thermodynamics, law of —

I. When mechanical work is transformed into heat or heat into work, the amount of work is always equivalent to the quantity of heat.

II. It is impossible by any continuous self-sustaining process for heat to be transferred from a colder to a hotter body.

Thermoelectric power is measured by the electromotive force produced by a thermocouple for unit difference of temperature between the two junctions. It varies with the average temperature and is usually expressed in microvolts per degree C. It is customary to list the thermoelectric power of the various metals with respect to lead. Dimensions, $[\varepsilon^{-1/2}\, m^{1/2}\, t^{-1}\, \theta^{-1}]$; $[\mu^{1/2}\, m^{1/2}\, l^{1/2}\, t^{-1}\, \theta^{-1}]$.

Thickness or average radius of ion atmosphere, κ^{-1} — The average distance of the ion atmosphere from the reference ion in angstrom units. This average distance decreases in magnitude with the square root of the ionic concentration. Mathematically, K^{-1} is the distance at which the average charge, dq, in a spherical shell of volume $4\pi r^2 dr$ reaches a maximum using the continuous density, ϱ (r), approximation.

Third law of thermodynamics — The statement that every substance has a finite positive entropy, and that the entropy of a crystalline substance is zero at the temperature of absolute zero. See Thermodynamic probability.

Modern quantum theory has shown that the entropy of crystals at 0° absolute is not necessarily zero. If the crystal has any asymmetry, it may exist in more than one state; and there is, in addition, an entropy residue deriving from nuclear spin.

Thomson thermoelectric effect is the designation of the potential gradient along a conductor which accompanies a temperature gradient. The magnitude and direction of the potential varies with the substance.

The coefficient of the Thomson effect or specific heat of electricity is expressed in joules per coulomb per degree Centigrade. Dimensions, $[\varepsilon^{-1/2}\, m^{1/2}\, l^{1/2}\, t^{-1}\, \theta^{-1}]$, $[\mu^{1/2}\, m^{1/2}\, l^{1/2}\, t^{-2}\, \theta^{-1}]$.

Time, unit of — The fundamental invariable unit of time is the ephemeris second, which is defined as 1/31,556,925.9747 of the tropical year for 1900 January 0^d12^h ephemeris time. The ephemeris day is 86,400 ephemeris seconds.

The former unit of time was the mean solar second, defined as 1/86,400 of the mean solar day.

Torque prouced by the action of one magnet on another — The turning moment experienced by a magnet of pole strength m′ and length 2l′ placed at a distance r from another magnet of length 2l and pole strength m, where the center of the first magnet is on the axis (extended) of the second and the axis of the first is perpendicular to the axis of the second,

$$C = 8\,\frac{mm'll'}{r^3} = \frac{2MM'}{r^3}$$

If the first magnet is deflected through an angle θ, the expression becomes,

$$C = \frac{2MM'}{r^3}\cos\theta$$

Torr — Provisional international standard term to replace the English term millimeter of mercury and its abbreviation mm of Hg (or the French mm de Hg).

The torr is defined as 1/760 of a standard atmosphere or 1,013,250/760 dynes per square centimeter. This is equivalent to defining the torr as 1333.22 microbars and differs by only one part in 7 million from the International Standard millimeter of mercury. The prefixes milli and micro are attached without hyphenation.

Torsional vibration — See Angular harmonic motion.

Total pressure — 1. Equals stagnation pressure. 2. Equals impact pressure. 3. The pressure a moving fluid would have if it were brought to rest without losses. 4. The pressure determined by all the molecular species crossing the imaginary surface.

Total reflection — When light passes from any medium to one in which the velocity is greater, refraction ceases and total reflection begins at a certain critical angle of incidence θ such that

$$\sin\theta = \frac{1}{n}$$

where n is the index of the first medium with respect to the second. If the second medium is air n has the ordinary value for the first medium. For any other second medium,

$$n = \frac{n_1}{n_2}$$

where n_1 and n_2 are the ordinary indices of refraction for the first and second medium respectively.

Tractive force of a magnet — If a magnet with induction B has a pole face of area A the force is,

$$F = \frac{B^2 A}{8\pi}$$

If B and A are in cgs units, F will be in dynes.

Transducer (acoustic) — A device to convert electrical oscillatory input energy into mechanical acoustical wave energy.

Transference (or transport) number — The transference number of each ion of a solute (or electrolyte) in an electrolytic solution is the fraction of the total current carried by that ion, and is given by the ratio of the mobility of the ion to the sum of the mobilities of the ions of the solute constituting the electrolytic solution.

Transmutation — A nuclear change producing a new element from an old one.

Transuranic elements — Elements of atomic numbers above 92. All of them are radioactive and are products of artificial nuclear changes. All are members of the actinide group.

Transverse electromagnetic energy — Wave whose electric field and magnetic field displacements are at right angles to each other and to the direction of propagation (motion) of the wave.

Triangle or polygon of forces — If three or more forces acting on the same point are in equilibrium, the vectors representing them form, when added, a closed figure.

Triple point — The thermodynamic state at which three phases of a substance exist in equilibrium.

The triple point of water occurs at a saturation vapor pressure of 6.11 millibar and at a temperature of 273.16° K.

Tritium — An isotope of hydrogen with a mass of three, structure, two neutrons, and one proton in its nucleus.

Ultrasound camera — A camera that converts a sound pressure "acoustic image" into an electrical TV-like image by means of the piezo-electric effect.

Uncertainty principle — See Indeterminancy.

Uniform circular motion — If r is the radius of a circle, v the linear speed in the arc, ω the angular velocity and T the period or time of one revolution,

$$\omega = \frac{v}{r} = \frac{2\pi}{T}$$

The acceleration toward the center is

$$a = \frac{v^2}{r} = \omega^2 r = \frac{4\pi^2 r}{T^2}$$

The centrifugal force for a mass m,

$$F = \frac{mv^2}{r} = m\omega^2 r = \frac{4\pi^2 mr}{T^2}$$

In the above equations ω will be in radians per second and a in cm per sec² if r is in cm, v in cm per sec and T in sec. F will be in dynes if mass is in grams and other units as above.

Application to the solar system — If M is the mass of the sun, G the constant of gravitation, P the period of the planet and r the distance of the planet from the sun, then the mass of the sun

$$M = \frac{4\pi^2 r^3}{GP^2}, \ (G = 6.670 \times 10^{-8} \text{ for cgs units})$$

If P is the period and r the distance of a satellite revolving around the planet, the above expression for M gives the mass of the planet. The formula is written on the assumption that the orbit of the planet or satellite is circular, which is only approximately true.

Uniformly accelerated rectilinear motion — If v_0 is the initial velocity, v_t the velocity after time t, the acceleration,

$$a = \frac{v_t - v_0}{t}$$

The velocity after time t,

$$v_t = v_0 + at$$

Space passed over in time t,

$$s = v_0 t + \tfrac{1}{2}at^2$$

Velocity after passing over space s,

$$v = \sqrt{v_0{}^2 + 2as}$$

Space passed over in the nth second

$$s = v_0 + \tfrac{1}{2}a(2n - 1)$$

In the above and following similar equations the values of the space, velocity, and acceleration must be substituted in the same system. For space in cm, velocity will be in centimeter per second and acceleration in centimeter per second per second.

Unit — Specific magnitude of a quantity, set apart by appropriate definition, which is to serve as a basis of comparison or measurement for other quantities of the same nature.

Universal time — Time defined by the rotational motion of the earth and determined from the apparent diurnal motions which reflect this rotation; because of variations in the rate of rotation, universal time is not rigorously uniform. Also called Greenwich mean time. Compare ephemeris time.

In the years preceding 1960 the arguments of the ephemerides in the American Ephemeris and Nautical Almanac were designated as universal time.

Valence of an atom of an element is that property which is measured by the number of atoms of hydrogen (or its equivalent) one atom of that element can hold in combination if negative, or can displace in a reaction if it is positive.

Valence electrons of the atom are electrons which are gained, lost or shared in chemical reactions.

Van Allen belt, Van Allen radiation belt — The zone of high-intensity particulate radiation surrounding the earth beginning at altitudes of approximately 1000 km.

The radiation of the Van Allen belt is composed of protons and electrons temporarily trapped in the earth's magnetic field. The intensity of radiation varies with the distance from the earth.

Van der Waals' equation of state — This equation is expressed by:

$$\left(p + \frac{a}{v^2}\right)(v - b) = RT$$

It makes allowance both for the volume occupied by the molecules and for the attractive force between the molecules. b is the effective volume of molecules in one mole of gas. a is a measure of the attractive force between the molecules. For values of R, a, and b see index for table of Van der Waals' constants for gases.

Van't Hoff's principle — If the temperature of interacting substances in equilibrium is raised, the equilibrium concentrations of the reaction are changed so that the products of that reaction which absorb heat are increased in quantity, or if the temperature for such an equilibrium is lowered, the products which evolve heat in their formation are increased in amounts.

Vapor — The words vapor and gas are often used interchangeably. Vapor is more frequently used for a substance which, though present in the gaseous phase, generally exists as a liquid or solid at room temperature. Gas is more frequently used for a substance that generally exists in the gaseous phase at room temperature. Thus one would speak of iodine or carbon tetrachloride vapors and of oxygen gas.

Vapor pressure — The pressure exerted when a solid or liquid is in equilibrium with its own vapor. The vapor pressure is a function of the substance and of the temperature.

Vectors, composition of — If the angle between two vectors is A, and their magnitude a and b, their resultant,

$$C = \sqrt{a^2 + b^2 - 2ab \cos A.}$$

Velocity — Time rate of motion in a fixed direction. Cgs units, one centimeter per second. Dimensions, $[l\,t^{-1}]$.

If s is space passed over in time t, the velocity,

$$\bar{v} = \frac{s}{t}$$

Velocity of a compressional wave — The velocity of a compressional wave in an elastic medium, in terms of elasticity E (bulk modulus) and density d,

$$V = \sqrt{\frac{E}{d}}$$

For the velocity of sound in air, where p is the pressure and d the density,

$$V = \sqrt{\frac{1.4p}{d}}$$

Velocity of efflux of a liquid — If h is the distance from the opening to the free surface of the liquid, the velocity of efflux is

$$V = \sqrt{2gh}$$

The above is the theoretical discharge velocity disregarding friction and the shape of orifice. For water issuing through a circular opening with sharp edges of area, A, the volume discharged per second is given approximately by,

$$Q = 0.624\sqrt{2gh}$$

Velocity of sound, variation with temperature — The velocity in meters per sec at any temperature t in °C is given approximately by

$$V = V_0\sqrt{1 + \frac{t}{273}}$$

$$V = 331.5 + 0.607t$$

The variation with humidity is given by the equation

$$V_d = V_h\sqrt{1 - \frac{e}{p}\ \frac{\gamma\omega}{\gamma a} - \frac{5}{8}}$$

where V_d is the velocity in dry air, V_h that in air at barometric pressure p in which the pressure of water vapor is e. γ_w and γ_a are the specific heat ratios for water vapor and for air respectively.

Velocity of a transverse wave is a stretched cord. If T is the tension of the cord and m the mass per unit length,

$$V = \sqrt{\frac{T}{m}}$$

Velocity of water waves — If the depth h is small compared with the wave length, the velocity,

$$V = \sqrt{gh}$$

In deep water for a wave length λ,

$$V = \sqrt{\frac{g\lambda}{2\pi}}$$

If the wavelength is very small, less than about 1.6 cm, the velocity increases as the wave length decreases and is expressed by the following,

$$V = \sqrt{\frac{2\pi T}{\lambda d} + \frac{g\lambda}{2\pi}}$$

where T is the surface tension and d the density of the liquid V will be given in cm per sec if h and λ are in cm, g in cm per sec², T in dyes per cm and d in g per cm³.

Velocity of a wave — The velocity of propagation in terms of wavelength λ and the period T or frequency n is,

$$V = \frac{\lambda}{T} = n\lambda$$

Virtual gravity — The force of gravity on an atmospheric parcel, reduced by centrifugal force due to the motion of the parcel relative to the earth. The virtual gravity g* is

$$g^* = g = V^2/a - 2\Omega_n V$$

where g is the magnitude of the acceleration of gravity; V is the parcel speed; a is the earth's radius; and Ω_n is the component of the earth's angular velocity vector normal to the motion of the parcel.

For reasonable atmospheric values, the correction terms are of the order of 0.01% of the magnitude of gravity. The identity of g* and g is implied by the assumption of hydrostatic equilibrium.

Virtual height — The apparent height of an ionized atmospheric layer determined from the time interval between the transmitted signal and the ionospheric echo at vertical incidence, assuming that the velocity of propagation is the velocity of light in a vacuum over the entire path. See Ionospheric recorder. Compare scale height.

Virtual image — An image that cannot be shown on a surface but is visible, as in a mirror.

Virtual mass — The actual mass of a body, plus its apparent additional mass.

Viscosity — All fluids possess a definite resistance to change of form and many solids show a gradual yielding to forces tending to change their form. This property, a sort of internal friction, is called viscosity; it is expressed in dyne-seconds per cm² or poises. Dimensions, $[m\,l^{-1}\,t^{-1}]$. If the tangential force per unit area, exerted by a layer of fluid upon one adjacent is one dyne for a space rate of variation of the tangential velocity of unity, the viscosity is one poise.

Kinematic viscosity is the ratio of viscosity to density. The c. g. s. unit of kinematic viscosity is the stoke.

Flow of liquids through a tube; where l is the length of the tube, r its radius, p the difference of pressure at the ends, η the coefficient of viscosity, the volume escaping per second,

$$v = \frac{\pi p r^4}{8 l \eta} \text{ (Poiseuille).}$$

The volume will be given in cm³ per second if l and r are in cm, p in dynes per cm² and η in poises or dyne-seconds per cm².

Viscosity effect — An alteration in the velocity of a given ion as a result of the contribution to the bulk viscosity owing to the ions of opposite charge. This effect applies to ions of large size.

Visibility is measured by the ratio of the luminous flux in lumens to the total radiant energy in ergs per second or in watts.

Volt — The unit of electric potential difference and electromotive force, equal to the difference of electric potential between two points of a conductor carrying a constant current of 1 ampere when the power dissipated between these points equals 1 watt.

Volume, unit of — The cubic centimeter, the volume of a cube whose edges are one centimeter in length. Other units of volume are derived in a similar manner. Dimension, $[l^3]$.

Volume velocity — Volume velocity is the rate of alternating flow of the medium through a specificed surface due to a sound wave.

Walden's rule, $\Lambda_o\eta_o$ — Walden's rule states that the product of the limiting equivalent conductance of an electrolytic solution, Λ_o, and the viscosity of the solvent, η_o, in which the solute (or electrolyte) is dissolved is a constant at a particular temperature. Walden's rule is an approximation which would be valid only for ions which behave hydrodynamically like Stokes spheres in a continuum.

Watt — Rate of doing work or expending power. A watt is that power which gives rise to the production of energy at a rate of 1 joule per second or 10^7 ergs per second.

Wave — A wave is a disturbance which is propagated in a medium in such a manner that at any point in the medium the quantity serving as measure of disturbance is a function of the time while at any instant the displacement at a point is a function of the position of the point.

Wavefront — Surface whose points in an energy beam are all of equal phase or optical path length.

Wavelength — Distance between successive wavefronts of like phase (i.e., from peak to peak, or trough to trough).

Wave motion — A progressive disturbance propagated in a medium by the periodic vibration of the particles of the medium. Transverse wave motion is that in which the vibration of the particles is perpendicular to the direction of propagation. Longitudinal wave motion is that in which the vibration of the particles is parallel to the direction of propagation.

Wave number (symbol v) — The reciprocal of wavelength; the number of waves per unit distance in the direction of propagation; or, sometimes 2π times this quantity.

In spectroscopy, wave number is usually expressed in reciprocal centimeters, as 100,000 cm^{-1} (100,000 per centimeter).

Weber (unit of magnetic flux) — The magnetic flux which, linking a circuit of one turn, produces in it an electromotive force of 1 volt as it is reduced to zero at a uniform rate in 1 second.

Weight — The force with which a body is attracted toward the earth. Cgs unit, — the dyne. Dimensions, $[m\, l\, t^{-2}]$.

Although the weight of a body varies with its location, the weights of various standards of mass are often used as units of force as, pound weight, or pound force, gram weight, etc. The weight of mass m, where g is the acceleration due to gravity,

$$W = mg$$

The weight will be given in dynes when m is in grams and g in centimeter per second squared.

Wheatstone's bridge — If the resistances r_1, r_2, r_3, and r_4 form the arms of a Wheatstone's bridge in order as the circuit (omitting cell and galvanometer connections) is traced, when the bridge is balanced,

$$\frac{r_1}{r_2} = \frac{r_4}{r_3} \qquad \text{or} \qquad \frac{r_1}{r_4} = \frac{r_2}{r_3}$$

Wien distribution law — A relation, derived on purely thermodynamic reasoning by Wien, between the monochromatic emittance of an ideal black body and that body's temperature.

$$J\lambda/T^5 = f(\lambda, T)$$

where J_λ is the monochromatic emittance (emissive power) of a black body at wavelength λ and absolute temperature T, and $f(\lambda, T)$ is a function which cannot be determined purely on classical thermodynamic grounds. Conpare Wien law.

Wien effect — The increase in the conductance of an electrolytic solution produced by high electrical fields (potential gradients).

Wien's displacement law — When the temperature of a radiating black body increases, the wave length corresponding to maximum energy decreases in such a way that the product of the absolute temperature and wave length is constant.

$$\lambda_{max} T = w$$

w is known as Wien's displacement constant.

Work — When a force acts against resistance to produce motion in a body the force is said to do work. Work is measured by the product of the force acting and the distance moved through against the resistance. Cgs units of work, the erg, a force of one dyne acting through a distance of one centimeter. The joule is 1×10^7 ergs. Dimensions, $[m\, l^2\, t^{-2}]$. The foot-pound is the work required to raise a mass of one pound a vertical distance of one foot where $g = 32.174$ ft/sec². The foot-poundal is the work done by a force of one poundal acting through a distance of one foot. The International joule, a unit of electrical energy, is the work expended per second by a current of one International ampere flowing through one International ohm. The kilowatt-hour is the total amount of energy developed in one hour by a power of one kilowatt.

If a force F act through a space s, the work done is

$$W = Fs$$

Work will be given in ergs if F is in dynes and s in centimeters.

Work done in rotation. If a torque L dyne-cm acts through an angle θ radians, the work done in ergs is

$$W = L\theta$$

Work function — The energy required for an electron to escape a solid surface. See Helmholtz function.

X-rays — A type of radiation of higher frequency than visible light but lower than gamma rays. Usually produced by high energy electrons impinging upon a metal target.

X units — X-ray wavelengths have been measured in two kinds of units. The older measurements are given in X units (XU) which are based on the effective lattice constant of rock salt being 2,814.00 XU. More recently X-ray wavelengths have been directly connected, through measurements with ruled gratings, to the wavelengths in the optical region and through them to the standard meter. It turned out that the XU which was originally intended as 10^{-11} cm was 0.202% larger than this value. It has become customary to give X-ray wavelengths in Angstrom units (A) when the absolute scale is used ($1\ \text{A} = 10^{-8}$ cm). The two are related by

$$1000\ \text{XU} = 1.00202 \pm 0.00003)\ \text{A}$$

and wavelengths given in XU must be multiplied by 1.00202 and then divided by 1000 in order to convert them into Angstrom units.

Yield point — The stress at which a marked increase in deformation takes place without increase in the load.

Yield strength — "The stress at which a material exhibits a specified permanent set."

Zeeman effect — The splitting of a spectrum line into several symmetrically disposed components, which occurs when the source of light is placed in a strong magnetic field. The components are polarized, the directions of polarization and the appearance of the effect depending on the direction from which the source is viewed relative to the lines of force.

PRIMARY FIXED POINTS OF INTERNATIONAL PRACTICAL TEMPERATURE SCALE-68 (IPTS-68)

Primary fixed points of IPTS-68 are given in degrees Celsius and kelvin. Also shown are the comparative values from previous international temperature scales.

Fixed point	ITS-27, °C	ITS-48, °C	IPTS-48, °C	IPTS-68		
				°C	K	Uncertainty (K)
Equilibrium between the liquid and vapor phases of water (boiling point of water)	100.000	100	100	100	373.15	0.005
Equilibrium between the solid and liquid phases of zinc (freezing point of zinc)				419.58	692.73	0.03
Equilibrium between the liquid and vapor phases of sulfur (boiling point of sulfur)	444.60	444.600	444.6			
Equilibrium between the solid and liquid phases of silver (freezing point of silver)	960.5	960.8	960.8	961.93	1,235.08	0.2
Equilibrium between the solid and liquid phases of gold (freezing point of gold)	1,063	1,063.0	1,063	1,064.43	1,337.58	0.2

From Sparks, L. L., *ASRDI Oxygen Technology Survey*, Vol. 4, Scientific and Technical Information Office, National Aeronautics and Space Administration, Washington, D. C., 1974.

This table permits one to convert from degrees Celsius to degrees Fahrenheit or from degrees Fahrenheit to degrees Celsius. The conversion is accomplished by first locating in a column printed in bold face type the number that is to be converted. If the number to be converted is in degrees Fahrenheit, one may find its equivalent in degrees Celsius by reading to the left. If the number to be converted is in degrees Celsius, one may find its equivalent in degrees Fahrenheit by reading to the right. Degrees Celsius are identical to degrees Centigrade. However, the word Celsius is preferred for international use.

The approved international symbolic abbreviation for degrees Celsius is °C, whereas for degrees Fahrenheit it is °F. Absolute zero on the Celsius scale is −273.15°C; on the Fahrenheit scale it is −459.67°F. The relation between degrees Fahrenheit and degrees Celsius may be expressed by

$$°\mathrm{C} = 5/9(°\mathrm{F} - 32) \text{ or}$$
$$°\mathrm{F} = 9/5(°\mathrm{C}) + 32.$$

[a] The average diameter of the warp and of the shoot wires, taken separately, of the cloth of any sieve shall not deviate from the nominal values by more than the following:

Sieves coarser than 600 μm	5 percent
Sieves 600 to 125 μm	$7\frac{1}{2}$ percent
Sieves finer than 125 μm	10 percent

* Resistance at the stated temperatures of a wire whose length is 1000 feet at 20°C.

ALLOWABLE CARRYING CAPACITIES OF CONDUCTORS

(National Electrical Code)

The ratings in the following tabulation are those permitted by the National Electrical Code for flexible cords and for interior wiring of houses, hotels, office buildings, industrial plants, and other buildings.

The values are for copper wire. For aluminum wire the allowable carrying capacities shall be taken as 84% of those given in the table for the respective sizes of copper wire with the same kind of covering.

Size A.W.G.	Area Circular Mils	Diameter of Solid Wires Mils	Rubber Insulation Amperes	Varnished Cambric Insulation Amperes	Other Insulations and Bare Conductors Amperes
18	1,624.	40.3	3*	...	6†
16	2,583.	50.8	6*	...	10†
14	4,107.	64.1	15	18	20
12	6,530.	80.8	20	25	30
10	10,380.	101.9	25	30	35
8	16,510.	128.5	35	40	50
6	26,250.	162.0	50	60	70
5	33,100.	181.9	55	65	80
4	41,740.	204.3	70	85	90
3	52,630.	229.4	80	95	100
2	66,370.	257.6	90	110	125
1	83,690.	289.3	100	120	150
0	105,500.	325.0	125	150	200
00	135,100.	364.8	150	180	225
000	167,800.	409.6	175	210	275
0000	211,600.	460	225	270	325

1 Mil = 0.001 inch.

* The allowable carrying capacities of No. 18 and 16 are 5 and 7 amperes respectively, when in flexible cords.

† The allowable carrying capacities of No. 18 and 16 are 10 and 15 amperes respectively, when in cords for portable heaters. Types AFS, AFSJ, HC, HPD, and HSJ.

CROSS-SECTION AND MASS OF WIRES

U. S. Measure

Diameters are given in mils (1 mil = .001 in.), and area in square mils (1 sq. mil = .000001 sq. in.). For sections and masses for one-tenth the diameters given, divide by 100 and for sections and masses for ten times the diameter multiply by 100.

CROSS-SECTION AND MASS OF WIRES (Continued)

Metric Measure

Diameters are given in thousandths of a centimeter and area of section in square thousandths of a centimeter. 1 $(cm/1000)^2$ = .000001 sq. cm For sections and masses for diameters 1/10 or 10 times those of the table, divide or multiply by 100.

RESISTANCE OF WIRES

The following table gives the approximate resistance of various metallic conductors. The values have been computed from the resistivities at 20°C, except as otherwise stated, and for the dimensions of wire indicated. Owing to differences in purity in the case of elements and of composition in alloys, the values can be considered only as approximations.

The following dimensions have been adopted in the computations.

B. & S. gauge	Diameter		B. & S. gauge	Diameter	
	mm	mils 1 mil = .001 in.		mm	mils 1 mil = .001 in.

COLOR CODE FOR RESISTORS

COLOR CODE FOR RESISTORS

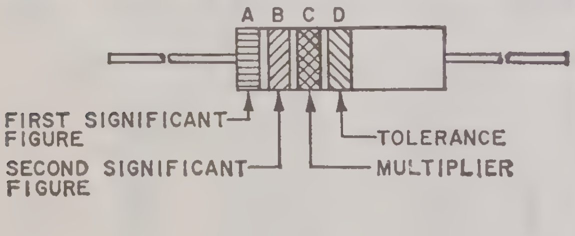
GENERAL REQUIREMENTS

Code Colors. Colors used for color coding shall conform to Standard MIL–STD–174, and shall be permanent and nonfading. The color-code marking shall remain legible after the resistor has been subjected to all the tests specified in the individual resistor specification.

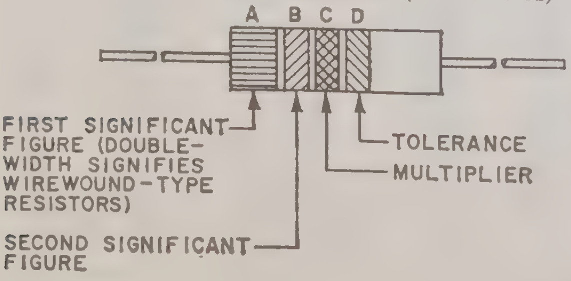
Body Colors (Background). The exterior body color of resistors shall be any color other than black; for composition-type resistors, tan is preferred, for wire-wound-type resistors, brown is preferred.

Conflict of Colors. When the body color is the same as any of the band colors, then either the body color or the band color shall be differentiated by shade or gloss.

COLOR CODE FOR RESISTORS (Not wire wound)



COLOR CODE FOR RESISTORS (Wire wound)



A B C D
FIRST SIGNIFICANT FIGURE (DOUBLE-WIDTH SIGNIFIES WIREWOUND-TYPE RESISTORS)
SECOND SIGNIFICANT FIGURE
TOLERANCE
MULTIPLIER

Band A		Band B		Band C		Band D	
Color	First significant figure	Color	Second significant figure	Color	Multiplier	Color	Resistance tolerance (per cent)
Black. . .	0	Black.	0	Black. . .	1	Silver. .	±10
Brown. .	1	Brown. . . .	1	Brown. . .	10	Gold. . .	±5
Red. . . .	2	Red.	2	Red.	100		
Orange. .	3	Orange. . .	3	Orange. .	1,000		
Yellow. .	4	Yellow. . .	4	Yellow. .	10,000		
Green. . .	5	Green. . . .	5	Green. . .	100,000		
Blue .	6	Blue	6	Blue. . . .	1,000,000		
Purple (viole.	7	Purple (violet). .	7	. . .	. . .		
Gray. . . .	8	Gray.	8	Silver. . .	0.01		
White. . .	9	White. . . .	9	Gold. . . .	0.1		

Band A—The first significant figure of the resistance value. (For composition-type resistors, all bands shall be of equal width. For wire-wound-type resistors, band A shall be double width.)

Band B—The second significant figure of the resistance value.
Band C—The multiplier. (The multiplier is the factor by which the two significant figures are multiplied to yield the nominal resistance value.)
Band D—The resistance tolerance.

Examples of color coding

3,900 ohms ±10 percent—Band A. orange; band B. white; band C, red; band D, silver.
43,000 ohms ±5 percent—Band A, yellow; band B, orange; band C orange; band D, gold.

[a] Total other elements requirement pertains only to the metallic elements for this filler metal.

[b] These chemical requirements pertain only to the copper oxide and do not include requirements for the organic vehicle in which the copper oxide is suspended.

[c] Total other elements requirement pertains only to metallic elements for this filler metal. The following limitations are placed on the nonmetallic elements:

Constituent	per cent (max)
Chlorides	0.4
Sulfates	0.1
Oxygen	remainder
Nitric acid insoluble	0.3
Acetone soluble matter	0.5

[d] Total other elements, including the elements marked with an asterisk (*), shall not exceed the value specified.

[e] This AWS-ASTM classification is intended to be identical with the same classification that appears in the Specification for Copper and Copper-Alloy Welding Rods (AWS Designation A5.7; ASTM Designation B 259).[3]

PHYSICAL DATA FOR THE PLANETS, THEIR SATELLITES AND SOME ASTEROIDS

Compiled by W. Joseph Armento, 1970

Data was gathered for inclusion in this table from some of the latest available references. Calculations were performed to verify the internal consistency of the interrelated quantities. The deviations are based on the spread of the data as gathered from the selected references and their respective uncertainties.

Certain data which were calculated include the length of the solar day, rotational velocity, centrifical force, isosynchronous satellite data, escape velocity, orbital velocity, synodic period, equilibrium temperature, solar constant, gravitational constant, and all conversions to "earth" units. In the last calculations, a standard deviation is carried in the data to indicate the error arising from the uncertainties in the Earth measurements.

Sidereal time is the time required for the body to return to the equivalent position as defined by the stars. An isosynchronous satellite placed over a point on an equator with no perturbations in the orbit, no eccentricity, and no deflection from the equator will appear to remain stationary in the sky (or remain over the same position on the body); the angular velocity of the body equals the angular velocity of the satellite. The synodic period is the time from conjunction to conjunction. The letter "R" indicates a retrograde or opposite motion to that of the Sun/Earth system.

The exponents for large numbers are expressed in the following form:

$$N \times 10^{m} = N\,E^{M}$$

i.e. $1.991 \pm 0.002\ E^{30}$ is equivalent
to $1.991 \times 10^{30} \pm 0.002 \times 10^{30}$

[a] Escape from Earth

*Earth Escape from

HOHMANN ELLIPSE TRANSFER DATA (MINIMUM ENERGY OF TRANSFER)

W. Joseph Armento

The "from" body is the body of departure and the "to" body is the body of arrival. The three lines of data for each planetary entry are:

top—from perhelion of inner planet to aphelion of outer planet
middle—from mean of inner planet to mean of outer planet
bottom—from aphelion of inner planet to perhelion of outer planet

The orbital parameters and velocities are given for the transfer orbit. The orbital velocity, change in velocity necessary to reach the new Hohmann orbital velocity, and the maximum change in velocity to reach the Hohmann orbital velocity are given for departure. For arrival data, look in the table listing the arrival planet as "from" and the departure planet as "to". The maximum Hohmann velocity change is assumed to be a single impulse to overcome the necessary energy for change in velocity and escape velocity from the surface of the departure planet.

					Orbital Velocity (km/sec)					Departure	
Body	Mean orbital Semimajor axis (km × 10^{-6})	Eccentricity ε	Aphelion (km × 10^{-6})	Perhelion (km × 10^{-6})	Mean	Aphelion	Perhelion	Orbital Velocity of Departure Body (km/sec)	Time of one way trip (½ orbit) (Solar Seconds)	Δ_V orbit (km/sec)	Maximum Δ_V (km/sec)

CONSTANTS FOR SATELLITE GEODESY

Defining Constants

1. Number of ephemeris seconds in 1 tropical year (1900) …… $s = 31\,556\,925.9747$
2. Gaussian gravitational constant, defining the a. u. …… $k = 0.017\,202\,09895$

Primary Constants

3. Velocity of light in meters per second …… $c = 299\,792.5 \times 10^3$
4. Dynamical form-factor for Earth …… $J_2 = 0.001\,082\,7$
5. Sidereal mean motion of Moon in radians per second (1900) …… $n_{\text{☾}}{}^* = 2.661\,699\,489 \times 10^{-6}$
6. General precession in longitude per tropical century (1900) …… $p = 5025''.64$
7. Constant of nutation (1900) …… $N = 9''.210$

Auxiliary Constants and Factors

$k/86400$, for use when the unit of time is 1 second …… $k' = 1.990\,983\,675 \times 10^{-}$

Number of seconds of arc in 1 radian …… $= 206\,264.806$

Factor for constant of aberration (note 10) …… $F_1 = 1.000\,142$

Factor for mean distance of Moon (note 12) …… $F_2 = 0.999\,093\,142$

Factor for parallactic inequality (note 15) …… $F_3 = 49853''.2$

Derived Constants

8. Solar parallax …… $\arcsin(\alpha_e/A) = \pi. = 8''.79405\ (8''.794)$
9. Light-time for unit distance …… $A/c' = \tau_A = 499^s.012$
   $= 1^s/0.002\,003\,96$
10. Constant of aberration …… $F_1 k' \tau_A = \kappa = 20''.4958\ (20''.496)$
11. Ratio of masses of Sun and Earth + Moon …… $S/E(1+\mu) = 328\,912$
12. Perturbed mean distance of Moon, in meters …… $F_2(GE(1+\mu)/n_{\text{☾}}{}^{*2})^{\frac{1}{3}} = \alpha_{\text{☾}} = 384\,400 \times 10^3$
13. Constant of sine parallax for Moon …… $\alpha_e/\alpha_{\text{☾}} = \sin \pi_{\text{☾}} = 3422''.451$
14. Constant of lunar inequality …… $\dfrac{\mu}{1+\mu}\dfrac{\alpha_{\text{☾}}}{A} = L = 6''.43987\ (6''.440)$
15. Constant of parallactic inequality …… $F_3 \dfrac{1-\mu}{1+\mu}\dfrac{\alpha_{\text{☾}}}{A} = P_{\text{☾}} = 124''.986$

THE EARTH: ITS MASS, DIMENSIONS AND OTHER RELATED QUANTITIES

From NASA Technical Translation NASA TT-F-533

TABLE A

Quantity	Unit of Measurement	Symbol	Numerical Value	Sources; Remarks[1]
Mass	Proportion of the mass of the sun	M	1/331950	I. D. Zhongolovich
	gram		$5.9763 \cdot 10^{27}$	
Major Orbital semi-axis	Astronomical unit	a_{orb}	1.000000	1961 data of Soviet radar determinations
	km		149,457,000	
Distance from sun at perihelion	a.u.	r_π	0.983298	for 1962
Distance from sun at aphelion	a.u.	r_α	1.016744	for 1962
Moment of perihelion passage		T_π	Jan. 2, $4^{hr}52^{m}$	for 1962 USSR Astron. Yearbook for 1962
Moment of aphelion passage		T_α	Jul 4 $5^{hr}05^{m}$	for 1962
Siderial rotation period around sun	sec	P_{orb}	$31.558 \cdot 10^6$	
Mean rotational velocity	km/sec	U_{orb}	29.8	
Mean equatorial radius	km	$\bar{a}$	6,378.245	A. A. Izotov, 1950
			6,378.077	I. D. Zhongolovich, 1956
Mean polar compression		α	1/298.3	A. A. Izotov, 1950
			1/296.6	I. D. Zhongolovich, 1952
			1/298.2	D. G. King-Hele, R. Merson, 1959. On observations on the movements of artificial earth satellites.
Difference in equatorial and polar semi-axes	km	$a - c$	21.382	A. A. Izotov, 1950
			21.500	I. D. Zhongolovich, 1956
Compression of meridian of major equatorial axis		α_a	1/295.2	I. D. Zhongolovich, 1952
Compression of meridian of minor equatorial axis		α_b	1/298.0	I. D. Zhongolovich, 1952
Equatorial compression		ϵ	1/30 000	A. A. Izotov, 1950
			1/32 000	I. D. Zhongolovich, 1952

TABLE A Continued

Quantity	Unit of Measurement	Symbol	Numerical Value	Sources; Remarks[1]
Difference in equatorial semi-axes	m	$a - b$	213 199	A. A. Izotov, 1950 I. D. Zhongolovich, 1952
Meridian of longitude of minor equatorial semi-axis		λ_a	15°E - 6°W	A. A. Izotov, 1950 I. D. Zhongolovich, 1952
Meridian of longitude of minor equatorial axis		λ_b	105°E - 75° W; 84°E - 96°W	A. A. Izotov, 1950 I. D. Zhongolovich, 1952
Difference in polar semi-axes	m	$C_N - C_S$	~ 70 <100	I. D. Zhongolovich, 1952 Based on observations of artificial satellites[1]
Polar asymmetry		η	$\sim 1.10^{-5}$	
Mean acceleration of gravity at equator		g_e	978,057.3	I. D. Zhongolovich, 1952
Mean acceleration of gravity at poles	milligals (mgl)	g_p	983,225.1	
Difference in acceleration of gravity at pole and at equator		$g_p - g_e$	+5,167.8	
Difference in acceleration of gravity at equator	mgl	$g_a - g_b$	+30.2	I. D. Zhongolovich, 1952
Difference in acceleration of gravity at poles		$g_N - g_S$	+30	I. D. Zhongolovich, 1952
Mean acceleration of gravity for entire surface of terrestrial ellipsoid	mgl	g	979,783.0	I. D. Zhongolovich, 1952
Mean radius	km	R	6,370.949	
Area of surface	km²	S	$510.0501 \cdot 10^{6}$	
Volume	km³	V	$1{,}083.1579 \cdot 10^{9}$	
Mean density	gr/cm³	δ	5.5170	I. D. Zhongolovich, 1952
Siderial rotational period	sec	P	86,164.09	
Angular rotational velocity	rad/sec	ω	$7.292116 \cdot 10^{-5}$	
Mean equatorial rotational velocity	km/sec	v	0.465	

TABLE A Continued

Quantity	Unit of Measurement	Symbol	Numerical Value	Sources; Remarks[1]
Ratio of centrifugal force to attractive force at equator		q	$\frac{1}{289}$	
Ratio of centrifugal force to force of gravity at equator		q_c	$0.0034677 = \frac{1}{288}$	I. D. Zhongolovich, 1952
Coefficients characterizing the radial distribution of densities within the earth		κ_1 κ	0.966 0.331	Based on observations of artificial satellites; several larger values were given earlier[1]
Radius of inertia	km; proportion of mean radius	R_i	3,674.735 0.5768	
Geocentric latitude of inertial parallel		ϕ_i	54°47′	
Moment of inertia	$gr \cdot cm^2$	I	$8.070 \cdot 10^{44}$	
Moment of rotation	$gr \cdot cm^2/sec$	L	$5.885 \cdot 10^{40}$	
Relative true secular braking of earth's rotation due to tidal friction		$\frac{\Delta\omega_e}{\omega}$	$-4.2 \cdot 10^{-8}$ per century	
Relative proper secular acceleration of earth's rotation		$\frac{\Delta\omega_i}{\omega}$	$+1.4 \cdot 10^{-8}$ per century	N. N. Pariyskiy, 1955
Relative observed secular braking of earth's rotation		$\frac{\Delta\omega}{\omega}$	$-2.8 \cdot 10^{-8}$ per century	
Mean rotational velocity of terrestrial radius due to abyssal compression	cm/century	$\frac{\Delta R}{\Delta t}$	~5 Assumed invariability of mass (M) 4.5 and distribution of masses (κ)	B. Meyermann, 1928, 1928a N. N. Pariyskiy, 1955
Secular variation in potential gravitational energy of earth accompanying reduction of terrestrial radius by 5 cm and corresponding increase in earth's kinetic energy	erg/century	ΔE	$\sim 17 \cdot 10^{30}$	Assumed uniformity of compression of entire planet. P. N. Kropotkin, 1948 and A. T. Aslanyan, 1955

---

[1] On the basis of materials published in the Astron. J., Vol. 64, 1272, 1959.

TABLE A Continued

Quantity	Unit of Measurement	Symbol	Numerical Value	Sources; Remarks[1]
Probable value of total energy of tectonic deformation of earth	erg/century	E_t	$\sim 1 \cdot 10^{30}$	With allowance for earthquakes, volcanic eruptions and other forms of tectonic activity P. N. Kropotkin, 1948
Secular loss of heat of earth through radiation into space	erg/century cal/century	$\Delta' E_k$	$1 \cdot 10^{30}$ $2.4 \cdot 10^{22}$	P. N. Kropotkin, 1948
Portion of earth's kinetic energy transformed into heat as a result of lunar and solar tides in the hydrosphere	erg/century cal/century	$\Delta'' E_k$	$0.11 \cdot 10^{30}$ $0.26 \cdot 10^{22}$	Heiskanen, 1922 and de Sitter, 1927
Difference in duration of days in March and August	sec	ΔP	0.0025 (March-Aug.)	N. N. Pariyskiy, 1955
Corresponding relative annual variation in earth's rotational velocity		$\frac{\Delta^* \omega}{\omega}$	$2.9 \cdot 10^{-8}$ (Aug.-March)	N. N. Pariyskiy, 1955
Presumed variation in earth's radius between August and March	cm	$\Delta^* R$	−9.2 (Aug.-March)	
Annual variation in level of world ocean	cm	Δh_0	~10 (Sept.-March)	N. N. Pariyskiy, 1955

TABLE B

Quantity	Unit of Measurement	Symbol	Numerical Value	Source
Area of continents	km^2; in % of area of surface of earth	S_C	$149 \cdot 10^6$ 29.2	E. Kossina, 1933
Area of world ocean	km^2; in % of area of surface of earth	S_o	$361 \cdot 10^6$ 70.8	E. Kossina, 1933
Mean height of continents above sea level	m	h_C	875	E. Kossina, 1933
Mean depth of world ocean	m	h_o	=3794	Morskoy Atlas, Vol. II, 1953
Mean position of earth's surface with respect to sea level	m	h_m	=2430	E. Kossina, 1933
Mean thickness of lithosphere within the limits of the continents	km	$h_{c.l.}$	35	M. Yuing and F. Press, 1955
Mean thickness of lithosphere within the limits of the ocean	km	$h_{o.l.}$	4.7	Kh. Khess, 1955
Mean rate of thickening of continental lithosphere	m/10^6 yr	$\frac{\Delta h}{\Delta t}$	10 – 40	V. I. Popov, 1955
Mean rate of horizontal extension of continental lithosphere	km/10^6 yr	$\frac{\Delta l}{\Delta t}$	0.75 – 20	V. I. Popov, 1955
Mass of lithosphere	gr	m_l	$2.367 \cdot 10^{25}$	A. Poldervart, 1955
Amount of water released from the mantle and core in the course of geological time	gr		$3.400 \cdot 10^{24}$	Kalp, 1951
Total reserve of water in the mantle	gr		$2 \cdot 10^{26}$	A. P. Vinogradov, 1959
Present day content of free and bound water in the earth's lithosphere	gr		$2.2 - 2.6 \cdot 10^{24}$ $1.8 - 2.7 \cdot 10^{24}$	Kalp, 1951 A. Poldervart, 1955
Mass of hydrosphere	gr	m_h	$1.664 \cdot 10^{24}$	A. Poldervart, 1955
Amount of oxygen bound in the earth's crust	gr		$1.300 \cdot 10^{24}$	A. Poldervart, 1955
Amount of free oxygen	gr		$1.5 \cdot 10^{21}$	A. Poldervart, 1955

TABLE B Continued

Quantity	Unit of Measurement	Symbol	Numerical Value	Source
Mass of atmosphere	gr	m_a	$5.136 \cdot 10^{21}$	A. Poldervart, 1955
Mass of biosphere	gr	m_b	$1.148 \cdot 10^{19}$	A. Poldervart, 1955
Mass of living matter in the biosphere	gr		$3.6 \cdot 10^{17}$	A. Poldervart, 1955
Density of living matter on dry land	gr/cm^2		0.1	A. Poldervart, 1955
Density of living matter in ocean	gr/cm^3		$15 \cdot 10^{-8}$	A. Poldervart, 1955

ESTIMATED AGE OF EARTH

TABLE C

Object of Study	Age in billions of years	Source
Fossils of the most ancient organisms	2.7	L. Arens, 1955
Most ancient known terrestrial rocks:		
Mica (biotite) found within migmatites on the Kola Peninsula and at the Great Rapids of the Voron'ya River in 1958;	3.6	A. A. Polkanov and E. K. Gerling, 1961
Rock found in South Africa	4	A. L. Heils, 1960[1]
Lithosphere	~ 4	V. I. Baranov, 1958
Earth	~ 5	A P. Vinogradov, 1959 and others

[2] Proterozoic II.

[3] Proterozoic I.

ACCELERATION DUE TO GRAVITY AND LENGTH OF THE SECONDS PENDULUM

For Sea Level at Various Latitudes

Based on the formula of the U. S. Coast and Geodetic Survey. The length of the simple pendulum whose period is two seconds, that is which beats seconds, is computed in each case from the corresponding value of the acceleration.

Latitude	Acceleration due to gravity		Length of seconds pendulum	
°	cm/sec.^{2}	ft./sec.^{2}	cm	in.
0	978.039	32.0878	99.0961	39.0141
5	978.078	32.0891	99.1000	39.0157
10	978.195	32.0929	99.1119	39.0204
15	978.384	32.0991	99.1310	39.0279
20	978.641	32.1076	99.1571	39.0382
25	978.960	32.1180	99.1894	39.0509

DATA IN REGARD TO THE EARTH

Quadrant of the equator, 10,019,150 meters, 6,225.60 miles.
Quadrant of the meridian, 10,002,290 meters, 6,215.12 miles.
1° latitude at the equator = 69.41 miles.
1° latitude at the pole = 68.70 miles.
Mean surface density of the continents, 2.67 g/cm^3, 166.7 lb./ft.^{3}
Land area, 148.847 × 10^6 km^2, 57.470 × 10^6 sq. mi.
Ocean area, 361.254 × 10^6 km^2, 139.480 × 10^6 sq. mi.

DATA IN REGARD TO THE EARTH
(Continued)

Highest mountain, Everest, 8,840 meters, 29,003 ft.
Greatest sea depth, 10,430 meters, 34,219 ft.
Thermal gradient of the earth, higher at increasing depths, 30°C per km, 48°C per mi. (uncertain).

THE COMMONER CHEMICAL ELEMENTS IN THE EARTH'S CRUST

Reprinted from "Principles of Geochemistry" (1952) with the permission of Brian Mason, author, and John Wiley and Sons, publishers.
The "Earth's Crust" refers to the rocks only and does not include atmosphere or the oceans. The atom percent column is obtained by dividing the weight percent by the atomic weights and reducing to 100%. The radius is the ionic radius. The volume percent is the atomic percent multiplied by $\frac{4}{3}\pi r^3$ and reducing to 100%.

Element	Weight %	Atom %	Ion Radius (Å)	Volume %
O	46.60	62.55	1.32	91.97

SOLAR SPECTRAL IRRADIANCE

From NASA Technical Report R-351, "The Solar Constant and the Solar Spectrum Measured from a Research Aircraft". Report edited by Matthew P. Thekaekara, Goddard Space Flight Center, Greenbelt, Maryland 20771. Discussion of previously reported values and of measurements and calculations leading to the following table are contained in the NASA Technical Report R-351.

SOLAR SPECTRAL IRRADIANCE—PROPOSED STANDARD CURVE

λ —Wavelength in microns
P_λ —Solar spectral irradiance averaged over small bandwidth centered at λ, in Watts $cm^{-2}\mu^{-1}$
A_λ—Area under the solar spectral irradiance curve in the wavelength range 0 to λ, mW cm^{-2}
D_λ—Percentage of the solar constant associated with wavelengths shorter than λ
Solar Constant—135.30 mW cm^{-2}, or 1.940 cal min^{-1} cm^{-2}

TOTAL MONTHLY SOLAR RADIATION IN A CLOUDLESS SKY

Total radiation is the sum of the direct and scattered radiation that strikes the earth's surface. It is influenced by the degree of cloudiness, atmospheric transparency, duration of sunshine, and height of elevation at which the measurements are taken. Deviations from values in this table are bound to occur; however, it is believed that the deviations do not exceed ±10% for the summer months and ±15% for the winter months. The radiation units in this table are kcal/cm^2.

ATMOSPHERIC AND METEOROLOGICAL DATA

Total mass of the atmosphere, estimated by Ekholm, 5.2×10^{21} g, 11.4×10^{18} pounds, 5.70×10^{16} tons.
Evidence of extent: twilight, 63 km, 39 mi.: meteors, 200 km, 124 mi.: aurora 44–360 km, 27–224 mi.

*Distance to Earth.

STANDARD ATMOSPHERE

U. S. Extension to International Civil Aviation Organization Standard Atmosphere, 1958

The atmosphere was classified in 1958 into three altitude regions designated as

a. Standard 0 to 32 standard geopotential kilometers
b. Tentative 32 to 75 " " "
c. Speculative 75 to 300 " " "

Properties of the atmosphere were calculated as functions of geometric altitude as well as geopotential, the potential being established for the latitude where the acceleration of gravity has a sea-level value of 9.80665 meters per second per second. Symbols and abbreviations used in these tables are as follows:

H – Altitude in geopotential measure
L_M = Molecular-scale-temperature gradient
M = Mean molecular weight of air
m = Meter
m' = Standard geopotential meter
P = Pressure
ρ = Mass density
T = Temperature in absolute thermodynamic scales
T_M = Molecular-scale temperature in absolute thermodynamic scales
Z = Altitude in geometric measure

Relationship between Geopotential and Geometric Altitude

The concept originally introduced by Bjerknes expresses vertical displacement in units of geopotential. Geopotential at an altitude Z is the potential energy of a unit mass at that altitude relative to the potential energy of that same unit mass at sea level. *Geopotential* H of a point at altitude Z may be rigorously defined as the increase in potential energy of a unit mass lifted from mean sea level to Z against the local force of gravity. Mathematically this definition becomes,

$$GH = \frac{\Delta E}{m} = \int_o^Z g(Z)\mathrm{d}Z$$

where

ΔE = increase in potential energy in joules,
m = mass of the body in kilograms,
$g(Z)$ = acceleration of gravity in m sec^{-2} expressed as a function of Z,
H = geopotential of a point at altitude Z,
G = proportionality factor depending on the units of H.

Solving this equation for H in terms of Z yields:

$$H = \frac{1}{G}\int_o^Z g(Z)\mathrm{d}Z.$$

The differential form of this relationship to be used later is

$$G\mathrm{d}H = g(Z)\mathrm{d}Z.$$

The basic unit of geopotential in these tables is one *standard geopotential* meter, m′, which is defined as 9.80665 m^2 sec^{-2} and which is equal to the vertical distance through which a one-kilogram mass must be lifted against the local force of gravity to increase its potential energy by 9.80665 joules. If the acceleration of gravity were constant at 9.80665 m sec^{-2} over an altitude interval of one geometric meter, one *standard geopotential* meter would be exactly equal to one geometric meter; this condition is true within two parts in a million at 45° 32′ 33″ at sea level, where g is equal to 9.80665 m sec^{-2}.

Relationship between Temperature and Molecular-scale Temperature

The molecular-scale temperature introduced by Minzner and Ripley is the defining atmospheric property of this Extension. This property is a composite of temperature and molecular weight, and is defined by the equation:

$$T_M = \left(\frac{T}{M}\right) M_o$$

where

T = temperature in the absolute thermodynamic scales,
T_M = molecular-scale temperature in the absolute thermodynamic scales,
M = molecular weight (nondimensional),
M_o = sea-level value of molecular weight.

No direct measurements of temperature have been made at altitudes above those which are reached by balloons; instead, the temperature is derived from values of the velocity of sound, or by substitution of measured pressures or densities into the barometric equation. The molecular-scale temperature can be derived in this way without specifying the molecular weight, whereas the temperature can be derived only if the molecular weight is known. Since the molecular weight is not well known at altitudes above 90 km, the molecular-scale temperature is more precisely known than temperature. Thus, the introduction of molecular-scale temperature increases the validity of some of the tabulated properties while simultaneously decreasing the complexity of the mathematics relating the basic atmospheric properties. The use of molecular-scale temperature also avoids the necessity for changing the defined atmosphere each time new values for the inadequately known molecular-weight distribution may be adopted.

SEA LEVEL ATMOSPHERIC COMPOSITION FOR A DRY ATMOSPHERE[a]

Constituent gas	Molecular fraction, %	Molecular weight ($0 = 15.999_4$)
Nitrogen (N_2)	78.09	14.0067
Oxygen (O_2)	20.95	31.998_8
Argon (Ar)	0.93	39.94_8
Carbon dioxide (CO_2)	0.03	44.01
Neon (Ne)	1.8×10^{-3}	20.117_9
Helium (He)	5.24×10^{-4}	4.00260
Krypton (Kr)	1.0×10^{-4}	83.80
Hydrogen (H_2)	5.0×10^{-5}	2.016
Xenon (Xe)	8.0×10^{-6}	131.30
Ozone (O_3)	1.0×10^{-6}	47.999_4
Radon (Rn)	6.0×10^{-18}	222

[a] These values are taken as standard and do not necessarily indicate the exact condition of the atmosphere. Ozone and radon particularly are known to vary at sea level and above, but these variations would not appreciably affect the value of M_O.

SEA LEVEL VALUES OF ICAO ATMOSPHERE

Property	Metric units

Viscosity, coefficient of	1.8247093×10^{-6} kgf sec m^{-2}

[a] kgf = kilogram (force)

STANDARD ATMOSPHERE

Nature of Ions in Unpolluted Air

Initially, all molecules are ionized with equal probability according to their abundance. After a sequence of charge transfer, molecular switching reactions, etc., these ions transform within less than 1 μs into the "fast ions" with the following "core composition:"

Dominant positive ions: $(NH_4)^+ \cdot (NH_3)_l \cdot (H_2O)_n$ $\quad 0 < H \lesssim 25$ km
$(H_3O)^+ \cdot (H_2O)_n$ $\quad 25 \lesssim H < 90$ km

the n, 1 depending on atmospheric temperature, water vapor concentration, and ammonia concentration;

Dominant negative ions: $O_2^- \cdot (H_2O)_m$ and $CO_4^- \cdot (H_2O)_m$ $H < 25$ km

the m depending on temperature and the ratio of water vapor to carbon dioxide concentration. Collisional interaction of these ions with atmospheric trace gases (with permanent dipoles or high polarizability) will lead to larger cluster ions through attachment and detachment reactions around the "core ion."

Compiled by V. A. Mohnen.

ATMOSPHERIC ELECTRICITY

HANS DOLEZALEK

Fair-weather electricity. Electrically, a fair-weather situation is given when the activity of local generators is low. Usually, this is supposed to be the case when there are no hydrometeors (rain, snow, hail, fog, droplets) and no highly charged dust in the air, cloudiness not more than 3/10 and not concentrated overhead, wind speed below 5 m/s (no white caps on sea). Under these conditions the atmospheric electric parameters over land have the average or typical values as shown in the table.

The "Classical Picture" is a group of hypotheses to explain the electrification of the atmosphere, the main hypothesis assuming that the ionosphere is charged by the thunderstorms to a high positive potential everywhere the same but varying in time. The classical picture is probably fundamentally correct but it has never been proven and probably requires supplements and corrections. In particular, extraterrestrial influences probably have to be admitted.

ELECTRICAL PARAMETERS OF THE CLEAR (FAIR-WEATHER) ATMOSPHERE, PERTINENT TO THE CLASSICAL PICTURE OF ATM. ELECTRICITY

All currents and fields listed are part of the global circuit, i.e., circuits of local generators are not included. Values are subject to variations due to latitude and altitude of the point of observation above sea level, locality with respect to sources of disturbances, meteorological and climatological factors, and man-made changes.

Part of atmosphere for which the values are calculated (Elements are in free, cloudless atmosphere):	Currents, I, in A; and current densities, i, in A/m²	Potential Differences, U, in V; field strength E in V/m; U = 0 at sea level	Resistances, R, in Ω; Columnar resistances, R_c, in Ω m²; and resistivities, ρ, in Ω m	Conductances, G, in Ω^{-1}; Columnar conductances G_c, in $\Omega^{-1}m^{-2}$; total conductivities, γ, in $\Omega^{-1}m^{-1}$	Capacitances, C, in F; Columnar capacitances, C_c, in F m^{-2} and capacitivities, ε, in F m^{-1}	Time constants τ, in seconds
Volume element at about sea level, one cubic meter	$i = 3 \times 10^{-12*}$	$E_0 = 1.2 \times 10^{2*}$	$\rho_0 = 4 \times 10^{13}$	$\gamma_0 = 2.5 \times 10^{-14}$	$\varepsilon_0 = 8.9 \times 10^{-12*}$	$\tau_0 = 3.6 \times 10^2$
Lower column of 1 m² cross section from sea level to 2 km height	same as above	at upper end: $U_l = 1.8 \times 10^5$	$R_{c1} = 6 \times 10^{16}$	$G_{c1} = 1.7 \times 10^{-17}$	$C_{c1} = 4.4 \times 10^{-15}$	$\tau_{c1} = 2.6 \times 10^2$
Volume element at about 2 km height, 1 m³	same as above	$E_2 = 6.6 \times 10^1$	$\rho_2 = 2.2 \times 10^{13(*)}$	$\gamma_2 = 4.5 \times 10^{-14}$	$\varepsilon_2 = 8.9 \times 10^{-12}$	$\tau_2 = 2 \times 10^2$
Center column of 1 m² cross section from 2 to 12 km	same as above	at upper end: $U_m = 3.15 \times 10^5$	$R_{cm} = 4.5 \times 10^{16}$	$G_{cm} = 5 \times 10^{-17}$	$C_{cm} = 8.8 \times 10^{-16}$	$\tau_{cm} = 1.8 \times 10^1$
Volume element at about 12 km height, 1 m³	same as above	$E_{12} = 4.2 \times 10^0$	$\rho_{12} = 1.3 \times 10^{12(*)}$	$\gamma_{12} = 4.0 \times 10^{-13}$	$\varepsilon_{12} = 8.9 \times 10^{-12}$	$\tau_{12} = 1.2 \times 10^1$
Upper column of 1 m² cross section from 12 to 65 km height	same as above	at upper end: $U_u = 3.5 \times 10^5$	$R_{cu} = 1.5 \times 10^{16}$	$G_{cu} = 2.5 \times 10^{-17}$	$C_{cu} = 1.67 \times 10^{-16}$	$\tau_{cu} = 6.7 \times 10^0$
Whole column of 1 m² cross section from 0 to 65 km height	same as above	at upper end: $U = 3.5 \times 10^5$	$R_c = 1.2 \times 10^{17}$	$G_c = 8.3 \times 10^{-18}$	$C_c = 1.36 \times 10^{-16}$	$\tau_c = 1.64 \times 10^1$
Total spherical capacitor area: 5×10^{14} m²	$I = 1.5 \times 10^3$	$U = 3.5 \times 10^{5*}$	$R = 2.4 \times 10^2$	$G = 4.2 \times 10^{-3}$	$C = 6.8 \times 10^{-2}$	$\tau = 1.64 \times 10^1$

Values with a star, *, are rough average values from measurement. A star in parentheses, (*), points to a typical value from one or a few measurements. All other values have been calculated from starred values, under the assumption, that at 2 km 50 % and at 12 km 90 % of the columnar resistance is reached. Voltage drop along one of the partial columns can be calculated by subtracting the value for the lower column from that of the upper one. Columnar resistances, conductances, and capacitances are valid for that particular part of the column which is indicated at left. Capacitances are calculated with the formula for plate capacitors, and this fact must be considered also for the time constants for columns.

According to measurements, U, the potential difference between 0 m and 65 km may vary by a factor of approx. 2 (two). The total columnar resistance, R_c, is estimated to vary up to a factor of 3 (three), the variation being due to either reduction of conductivity in the exchange layer (about lowest 2 km of this table) or to the presence of high mountains, in both cases the variation is caused in the troposphere. Smaller variations in the stratosphere and mesosphere discussed because of aerosol there. The air-earth current density in fair-weather varies by a factor of 3 to 6 accordingly. Conductivity near the ground varies by a factor of about 3 (three) but only decreasing, increase of conductivity due to extraordinary radioactivity is a singular event. The field strength near the ground varies as a consequence of variations of air-earth current density and conductivity from about 1/3 to about 10 of the value quoted in the table. Conductivity near the ground shows a diurnal and an annual variation which depends strongly on the locality, air-earth current density shows a diurnal and annual variation because the earth-ionosphere potential difference undergoes such variations, and because also the columnar resistance is supposed to have a diurnal and probably an annual variation.

Conductivities and air-earth current densities on high mountains are by factors of up to 10 greater than at sea level. Conductivity decreases when atmospheric humidity increases. Values for space charges not quoted because measurements are too few to allow calculation of average values. Values of parameters over the oceans still rather uncertain.

Ions. Ionization rate at ground level over land: from radioactive substances in the ground: 4.0; from radioactive substances in the air: 4.6; from cosmic radiation 1.5–1.8, total (10.1–10.4) × 10^6 ion pairs per m^{-3} and sec. Over ocean far from shore: cosmic radiation only, but in spite of smaller ionization over the ocean conductivity is nearly equal to that over land because of longer ion life time (a consequence of smaller aerosol density).

Contribution from radioactive material over land decreases with altitude in the free air, from cosmic radiation increases (up to a certain level) and depends on latitude. Number densities of fast ions over land and ocean average at (4–5) × 10^8 m^{-3}, varying with height by only about one order of magnitude up to ionospheric C-layer. Their life time varies from about 10 s in aerosol-rich air to 300 s in pure air. All values quoted are approximate averages.

Ion classes in lower atmosphere	Designation	Mobilities in m²/(Vs)	Size ranges, radii in m
Primary atmospheric ions:	Fast ions (also called small or light ions)	$k \geq 10^{-4}$	$r < 6.6 \times 10^{-10}$
Secondary atmospheric ions: slow ions (also called large or heavy ions	Fast intermediate ions	$10^{-4} > k \geq 10^{-2}$	$6.6 \times 10^{-10} < r < 7.8 \times 10^{-9}$
	Slow intermediate ions	$10^{-2} > k \geq 10^{-1}$	$7.8 \times 10^{-9} < r < 2.5 \times 10^{-8}$
	Langevin ions	$10^{-1} > k \geq 2.5$	$2.5 \times 10^{-8} < r < 5.7 \times 10^{-8}$
	Ultralarge ions	$k < 2.5$	$5.7 \times 10^{-8} < r < 10^{-7}$

Electric conduction current in atmosphere carried nearly exclusively by the fast ions because number densities of the intermediate ions generally one order of magnitude smaller.

Nature of ions in pure air ("Standard Atmosphere"): initially all molecules are ionized with equal probability according to their abundance, but within nanoseconds these ions transform into the "fast ions" with the following composition:

positive ions: $(H_3O)^+(H_2O)_n$

negative ions: $O_2^-(H_2O)_n$, or $CO_4^-(H_2O)_n$;

the n depending on atmospheric temperature and water vapor pressure, varies very often in the life time of an ion. Most probable values of n for positive ions: troposphere 6 or 7, stratosphere 4, mesosphere 3 or 2.

Thunderstorm electricity. Clouds are generally more or less electrified. In thunderstorms, mechanical, thermodynamical and maybe chemical energy is transformed into electrical energy (generator) with separate poles. Most thunderstorms have during most of their life time (phases: development 10–20, mature 15–30, decay 30 min) a positive charge center above and a negative one below, probably another positive one near the base. Electrification occurs (according to processes not yet fully understood) in periods of tens of minutes and spaces of about 1 km^3, and there may be several such centers in a cloud. Thunderclouds mostly reach beyond freezing level, in moderate latitudes from about 3 to 10 km, in the tropics often up to 16–20 km, seldom more. 1000 to 2000 thunderstorms active at any time. Updrafts in storms up to 30 m/s. Water content 10^8–10^9 kg. Total energy about 10^{15} joule, electric energy 10^{12}–10^{13} J. Electric potential vs. ground at negative and positive charge centers: minus and plus 10–100 MV, resp.; field strength not yet measured reliably. Electric resistances of an atmospheric vertical column of 50 km^2 cross section: several 100 MΩ each between ground and negative center, negative and positive center, and positive center and ionosphere. Total current flowing upwards towards ionosphere derived from (still unsufficient) measurements of current densities: 0.5–2 A per thunderstorm cell. Current below cloud carried by conduction by fair-weather ions, conduction by corona ions, convection by vertical winds, precipitation, and lightning. Field strength at ground under storm: varying in strength and polarity, often 10 kV/m and more.

Atmospheric Electricity by H. Israël. Tabular material reproduced from this publication. Permission received from Israel Program for Scientific Translations.

Lightning, during its life time of up to a second, undergoes numerous variations and all its parameters change by orders of magnitude in these. Also, there are many different forms of lightning. Even disregarding particular forms such as ball lightning, we find at least four classification criteria which, taken together, give a great number of differences: intercloud, intracloud, and cloud-to-ground discharges and combinations of these; short high-current and long low-current flashes; lightnings beginning in the cloud and moving towards ground, and lightnings moving upwards; lightnings lowering positive and lightnings lowering negative charges, and those which do first the one and then the other. The usual cloud-to-ground lightning begins with a stepped leader of low luminosity, probably a meter or so in diameter, followed by a return stroke with a diameter in the order of centimeters, temperatures of about 30,000 K, and pressures of up to a MN/m^2. After this, a dart leader may again move downwards causing a second return stroke. This may repeat several times (multiple stroke flash).

Typical voltage drop in ground or other conductors after lightning impact in the neighborhood: 10 kV/m (dangerous!).

Intracloud lightnings observed with up to 100 km length.

There are probably about 100 lightnings occurring on earth at any time. Lightning frequency over oceans only about 1/10 from that over continents. Diurnal variations on continents show maximum in late afternoon and early evening, over oceans late evening until after midnight.

Energy delivered to a stroke about 100 kJ/m.

Upward lightnings initiated mostly from high masts and towers and mountains. Over flat terrain mostly downward flashes, probably generally met by short (decameters) upwards moving darts.

Height from which a lightning points at a target probably several decameters, depending on conductivity distribution in ground.

Long-lasting low-current (hundreds of amperes) flashes more dangerous to man and more damaging to objects (forest fires) than short high-current flashes.

Sferics, etc. Lightning generates a sudden variation of electric field (decreasing with r^{-3}), a quickly varying magnetic field (r^{-2}) and an electromagnetic radiation (r^{-1}) from a few hertz (in case of excitation of ionosphere-earth resonance range around the globe) through VLF (maximum intensity, range up to 10 Mm and more depending on direction and time of day) into VHF. Main frequency of thunder about 200 Hz.

Data for a normal cloud-to-ground lightning discharge bringing negative charge to earth. The values listed are intended to convey a rough feeling for the various physical parameters of lightning. No great accuracy is claimed since the results of different investigators are often not in good agreement. These values may in fact, depend on the particular environment in which the lightning discharge is generated. The choice of some of the entries in the table is arbitrary.

	Minimum*	Representative	Maximum*
Stepped leader			
Length of step, *m*	3	50	200
Time interval between steps, μsec	30	50	125
Average velocity of propagation of stepped leader, m/sec†	1.0×10^5	1.5×10^5	2.6×10^6
Charge deposited on stepped-leader channel, coulombs	3	5	20
Dart leader			
Velocity of propagation, m/sec†	1.0×10^6	2.0×10^6	2.1×10^7
Charge deposited on dart-leader channel, coulombs	0.2	1	6
Return stroke‡			
Velocity of propagation, m/sec†	2.0×10^7	5.0×10^7	1.4×10^8
Current rate of increase, kA/μsec§	<1	10	>80
Time to peak current, μsec§	<1	2	30
Peak current, kA§		10–20	110
Time to half of peak current μsec	10	40	250
Charge transferred excluding continuing current, coulombs	0.2	2.5	20
Channel length, km	2	5	14
Lightning flash			
Number of strokes per flash	1	3–4	26
Time interval between strokes in absence of continuing current, msec	3	40	100
Time duration of flash, sec	10^{-2}	0.2	2¶
Charge transferred including continuing current, coulombs	3	25	90

* The words maximum and minimum are used in the sense that most measured values fall between these limits.

† Velocities of propagation are generally determined from photographic data and thus represent "two-dimensional" velocities. Since many lightning flashes are not vertical, values stated are probably slight underestimates of actual values.

‡ First return strokes have slower average velocities of propagation, slower current rates of increase, longer times to current peak, and generally larger charge transfer than subsequent return strokes in a flash.

§ Current measurements are made at the ground.

¶ A lightning flash lasting 15 to 20 sec has been reported by Godlonton (1896).

Lightning by M. A. Uman, Table 1.1, page 4. Tabular material reproduced from this publication. Permission received from McGraw-Hill Book Company.

CRYSTAL IONIC RADII OF THE ELEMENTS

Numerical values of the radii of the ions may vary depending on how they were measured. They may have been calculated from wavefunctions and determined from the lattice spacings or crystal structure of various salts. Different values are obtained depending on the kind of salt used or the method of calculating. Data for many of the rare-earth ions were furnished by F. H. Spedding and K. Gschneidner.

BOND LENGTHS BETWEEN CARBON AND OTHER ELEMENTS

Prepared by Olga Kennard.

The tables are based on bond distance determinations, by experimental methods, mainly X-ray and electron diffraction, and include values published up to January 1, 1956. In the present tables, for the sake of completeness individual values of bond distances of lower accuracy are quoted with limits of error indicated where possible. Values for tungsten and bismuth should be treated with particular caution.

According to the statistical theory of errors if an average quantity $\bar{\mu}$ and a standard deviation σ can be evaluated there is a 95% probability that the true value lies within the interval $\bar{\mu} \pm 2\sigma$. Too much reliance should, however, not be placed on σ values in bond distance determinations since the derivation of these certain sources of error may have been neglected.

Values of the bond lengths and the limits of error are each given in Angstrom units.

Reproduced by permission from International Tables for X-ray Crystallography.

CARBON-CARBON

Single Bond

Paraffinic	1.541 ± 0.003
In diamond (18°C)	1.54452 ± 0.00014

Partial Double Bond

(1) Shortening of single bond in presence of carbon carbon double bond, e.g. $(CH_3)_2$-C:CH_2; or of aromatic ring e.g. C_6H_5.-CH_3	1.53 ± 0.01
(2) Shortening in presence of a carbon oxygen double bond e.g. CH_3CHO	1.516 ± 0.005
(3) Shortening in presence of two carbon-oxygen double bonds, e.g. $(CO_2H)_2$	1.49 ± 0.01
(4) Shortening in presence of one carbon-carbon triple bond, e.g. CH_3.C:CH	1.460 ± 0.003
(5) In compounds with tendency to dipole formation, e.g. C:C.C:N	1.44 ± 0.01
(6) In graphite (at 15°C)	1.4210 ± 0.0001
(7) In aromatic compounds	1.395 ± 0.003
(8) In presence of two carbon carbon triple bonds, e.g. HC:C.C:CH	1.373 ± 0.004

Double Bond

(1) Simple	1.337 ± 0.006
(2) Partial triple bond, e.g. CH_2:C:CH_2	1.309 ± 0.005

Triple Bond

(1) Simple, e.g. C_2H_2	1.204 ± 0.002
(2) Conjugated, e.g. $CH_3.(C:C)_2.H$	1.206 ± 0.004

CARBON-HYDROGEN

(1) Paraffinic (a) in methane	1.091
(b) in monosubstituted carbon	1.101 ± 0.003
(c) in disubstituted carbon	1.073 ± 0.004
(d) in trisubstituted carbon	1.070 ± 0.007
(2) Olefinic, e.g. CH_2:CH_2	1.07 ± 0.01
(3) Aromatic in C_6H_6	1.084 ± 0.006
(4) Acetylenic, e.g. CH:C.X	1.056 ± 0.003
(5) Shortening in presence of a carbon triple bond, e.g. CH_3CN	1.115 ± 0.004
(6) In small rings, e.g. $(CH_2)_2S$	1.081 ± 0.007

BOND LENGTHS BETWEEN CARBON AND OTHER ELEMENTS (Continued)

CARBON-NITROGEN

Single Bond

(1) Paraffinic (a) 4 co-valent nitrogen	1.479	± 0.005
(b) 3 co-valent nitrogen	1.472	± 0.005
(2) In C—N= e.g. CH_3NO_2	1.475	± 0.010
(3) Aromatic in $C_6H_5NHCOCH_3$	1.426	± 0.012
(4) Shortened (partial double bond) in heterocyclic systems, e.g. C_5H_5N	1.352	± 0.005
(5) Shortened (partial double bond) in N—C=O e.g. $HCONH_2$	1.322	± 0.003

Triple Bond

(1) In R.C⋮N	1.158	± 0.002

CARBON-OXYGEN

Single Bond

(1) Paraffinic	1.43	± 0.01
(2) Strained e.g. epoxides	1.47	± 0.01
(3) Shortened (partial double bond) as in carboxylic acids or through influence of aromatic ring, e.g. salicylic acid	1.36	± 0.01

Double Bond

(1) In aldehydes, ketones, carboxylic acids, esters	1.23	± 0.01
(2) In zwitterion forms, e.g. DL serine	1.26	± 0.01
(3) Shortened (partial triple bond) as in conjugated systems	1.207	± 0.006
(4) Partial triple bond as in acyl halides or isocyanates	1.17	± 0.01

CARBON-SULPHUR

Single Bond

(1) Paraffinic, e.g. CH_3SH	1.81(5)	± 0.01
(2) Lengthened in presence of fluorine, e.g. $(CF_3)_2S$	1.83(5)	± 0.01
(3) Shortened (partial double bond) as in heterocyclic systems, e.g. C_4H_4S	1.73	± 0.01

Double Bond

(1) In ethylene thiourea	1.71	± 0.02
(2) Shortened (partial triple bond) in presence of second carbon double bond, e.g. COS	1.558	± 0.003

BOND LENGTHS AND ANGLES OF CHEMICAL
COMPOUNDS (Continued)

STRENGTHS OF CHEMICAL BONDS*

J. A. Kerr and A. F. Trotman-Dickenson

The strength of a chemical bond, $D(R-X)$, often known as the bond dissociation energy, is defined as the heat of the reaction: $RX \rightarrow R + X$. It is given by $D(R-X) = \Delta Hf^\circ(R) + \Delta Hf^\circ(X) - \Delta Hf^\circ(RX)$. Some authors list bond strengths for O K but here the values for 298 K are given because more thermodynamic data are available for this temperature. Bond strengths, or bond dissociation energies, are not equal to, and may differ considerably from, mean bond energies derived solely from thermochemical data on molecules and atoms.

Bond Strengths in Diatomic Molecules

These have usually been measured spectroscopically or by mass spectrometric analysis of hot gases effusing from a Knudsen cell. Excellent accounts of these and other methods are given in Reference 61. The errors quoted are those given in the original paper or review article. The references have been chosen primarily as a key to the literature. It should not be assumed that the author referred to was responsible for the determination quoted, as the reference may be only to a review article.

D°_o values have been converted to D°_{298} by use of the simple relation

$$D^\circ_{298} = D^\circ_O + (3/2)RT$$

The table has been arranged in alphabetical order with no regard to electronegativity or any other property of the atoms.

Table 1
BOND STRENGTHS IN DIATOMIC MOLECULES

Heats of Formation of Gaseous Atoms from Elements in Their Standard States

For elements that are diatomic gases in their standard states these are readily obtained from the bond strength. For elements that are crystalline in their standard states they are derived from vapor pressure data.

Table 2
HEATS OF FORMATION OF GASEOUS ATOMS FROM ELEMENTS IN THEIR STANDARD STATES

Bond Strengths in Polyatomic Molecules

The values below refer to a temperature of 298 K and have mostly been determined by kinetic methods (see References 9 and 48 following Table 3 for a full discussion of the methods).

Some have been calculated from the heats of formation of the species involved according to the equations:

$$D(R - X) = \Delta H_f^\circ(\dot{R}) + \Delta H_f^\circ(\dot{X}) - \Delta H_f^\circ(RX)$$

$$D(R - R) = 2\Delta H_f^\circ(\dot{R}) - \Delta H_f^\circ(RR)$$

The sources of the data on the heats of formation are given in the references following Table 3.

An attempt has been made to list all the important values obtained by methods that are considered to be valid. The references are intended to serve as a guide to the literature.

Heats of Formation of Free Radicals

The heats of formation of the free radicals are related to the corresponding bond strengths by the equations

$$D(R - X) = \Delta H_f^\circ(\dot{R}) + \Delta H_f^\circ(\dot{X}) - \Delta H_f^\circ(RX)$$

or

$$D(R - R) = 2\Delta H_f^\circ(\dot{R}) - \Delta H_f^\circ(RR)$$

For an excellent review of the methods of determining the heats of formation of free radicals the reader is referred to "Thermochemistry of Free Radicals" by H. E. O'Neal and S. W. Benson in *Free Radicals*, Kochi, J. K., Ed., John Wiley and Sons, New York, 1973, 275.

The references are the same as given for Table 3.

Bond Strengths of Some Organic Molecules

Bond strengths at 298 K expressed in kcal/mol for some organic molecules of the general formula R—X are presented below. Some are experimental values taken from the preceding tables; the remainder are calculated from the heats of formation of the radicals, listed above, and the heats of formation of the parent compounds from sources indicated by the references below. The table also includes the bond strengths for ammonia, water, and the hydrogen halides.

Table 5

THE MADELUNG CONSTANT AND CRYSTAL LATTICE ENERGY

Donald F. Swinehart

If U is the crystal lattice energy and *M* is the Madelung constant, then

$$U = \frac{N M z_i z_j e^2}{r}(1 - 1/n)^{a}$$

Substance	Ion type	Crystal form[b]	*M*
Sodium chloride, NaCl	M^+, X^-	FCC	1.74756
Cesium chloride, CsCl	M^+, X^-	BCC	1.76267
Calcium chloride, $CaCl_2$	$M^{++}, 2X^-$	Cubic	2.365
Calcium fluoride, fluorite, CaF_2	$M^{++}, 2X^-$	Cubic	2.51939
Cadmium chloride, $CdCl_2$	$M^{++}, 2X^-$	Hexagonal	2.244[c]
Cadmium iodide, $CdI_2(\alpha)$	$M^{++}, 2X^-$	Hexagonal	2.355[c]
Magnesium fluoride, MgF_2	$M^{++}, 2X^-$	Tetragonal	2.381[c]
Cuprous oxide, cuprite, Cu_2O	$2M^+, X^{=}$	Cubic	2.22124
Zinc oxide, ZnO	$M^{++}, X^{=}$	Hexagonal	1.4985[c]
Sphalerite, zinc blende, ZnS	$M^{++}, X^{=}$	FCC	1.63806
Wurtzite, ZnS	$M^{++}, X^{=}$	Hexagonal	1.64132[c]
Titanium dioxide, anatase, TiO_2	$M^{4+}, 2X^{=}$	Tetragonal	2.400[c]
Titanium dioxide, rutile, TiO_2	$M^{4+}, 2X^{=}$	Tetragonal	$(2.408) - (2.055)(0.721 - c/a)^2$[d]
β-Quartz, SiO_2	$M^{4+}, 2X^{=}$	Hexagonal	2.2197[c]
Corundum, Al_2O_3	$2M^{3+}, 3X^{=}$	Rhombohedral	4.1719

[a] N is Avogadro's number, z_i and z_j are the integral charges on the ions (i.e., in units of the electronic charge), and e is the charge on the electron in electrostatic units ($e = 4.803 \times 10^{-10}$ ESU). r is the shortest distance between cation-anion pairs in centimeters. Then U is in ergs.

[b] FCC = face centered cubic, BCC is body centered cubic.

[c] For tetragonal and hexagonal crystals the value of *M* depends on the details of the lattice parameters.

[d] For rutile-type structures, *M* is given to a good approximation by inserting the proper c/a ratio. c/a for rutile itself is 0.721 and *M* = 2.408.

Note: Several variations of the equation for U appear in the literature with corresponding variations in *M*. In general, using literature values for *M* requires caution. The Born exponent, n, may be obtained from the following table:

THE BORN EXPONENT, n

Ion type	n
He, Li^+	5
Ne, Na^+, F^-	7
Ar, K^+, Cu^+, Cl^-	9
Kr, Rb^+, Ag^+, Br^-	10
Xe, Cs^+, Au^+, I^-	12

For a crystal with a mixed-ion type, an average of the values of n in this table is to be used (6 for LiF, for example).

VALUES OF THE GAS CONSTANT, R

Coleman J. Major

The numerical value of the gas constant, R, defined by the equation PV = nRT, depends upon the units of P, V, n, and T. A large number of values of the constant may be calculated. The accompanying table gives 84 values of R in a convenient form using the most common units of pressure and volume. It also incorporates both the pound and gram mole and both Rankine and Kelvin temperature scales. Various combinations of metric and English units may, therefore, be used without the necessity of converting each variable to a common system of units. Conversion factors and constants used for computing the values of R are listed at the bottom of the table.

The following example illustrates the use of the table:

Calculate: The volume in ft^3 occupied by 2 lb. moles of a gas at 15°C at a pressure of 32.2 ft. of water, assuming the ideal gas law.

Solution: $15°C + 273.2 = 288.2°K$

Enter the top of the table under the column headed "ft H_2O" and proceed downward to the value of 44.6 for R. (Note that this lines up horizontally with the desired units of ft^3, °K, and lb. moles shown on the left side of the table)

$$V = \frac{nRT}{P} = \frac{2 \times 44.6 \times 288.2}{32.2} = 798\ ft^3$$

Values of Gas Constant, $R = \frac{PV}{nT}$

Absolute Pressure

Volume	Temp.	moles	Atm	psia	mm Hg	cm Hg	in Hg	in H_2O	ft H_2O

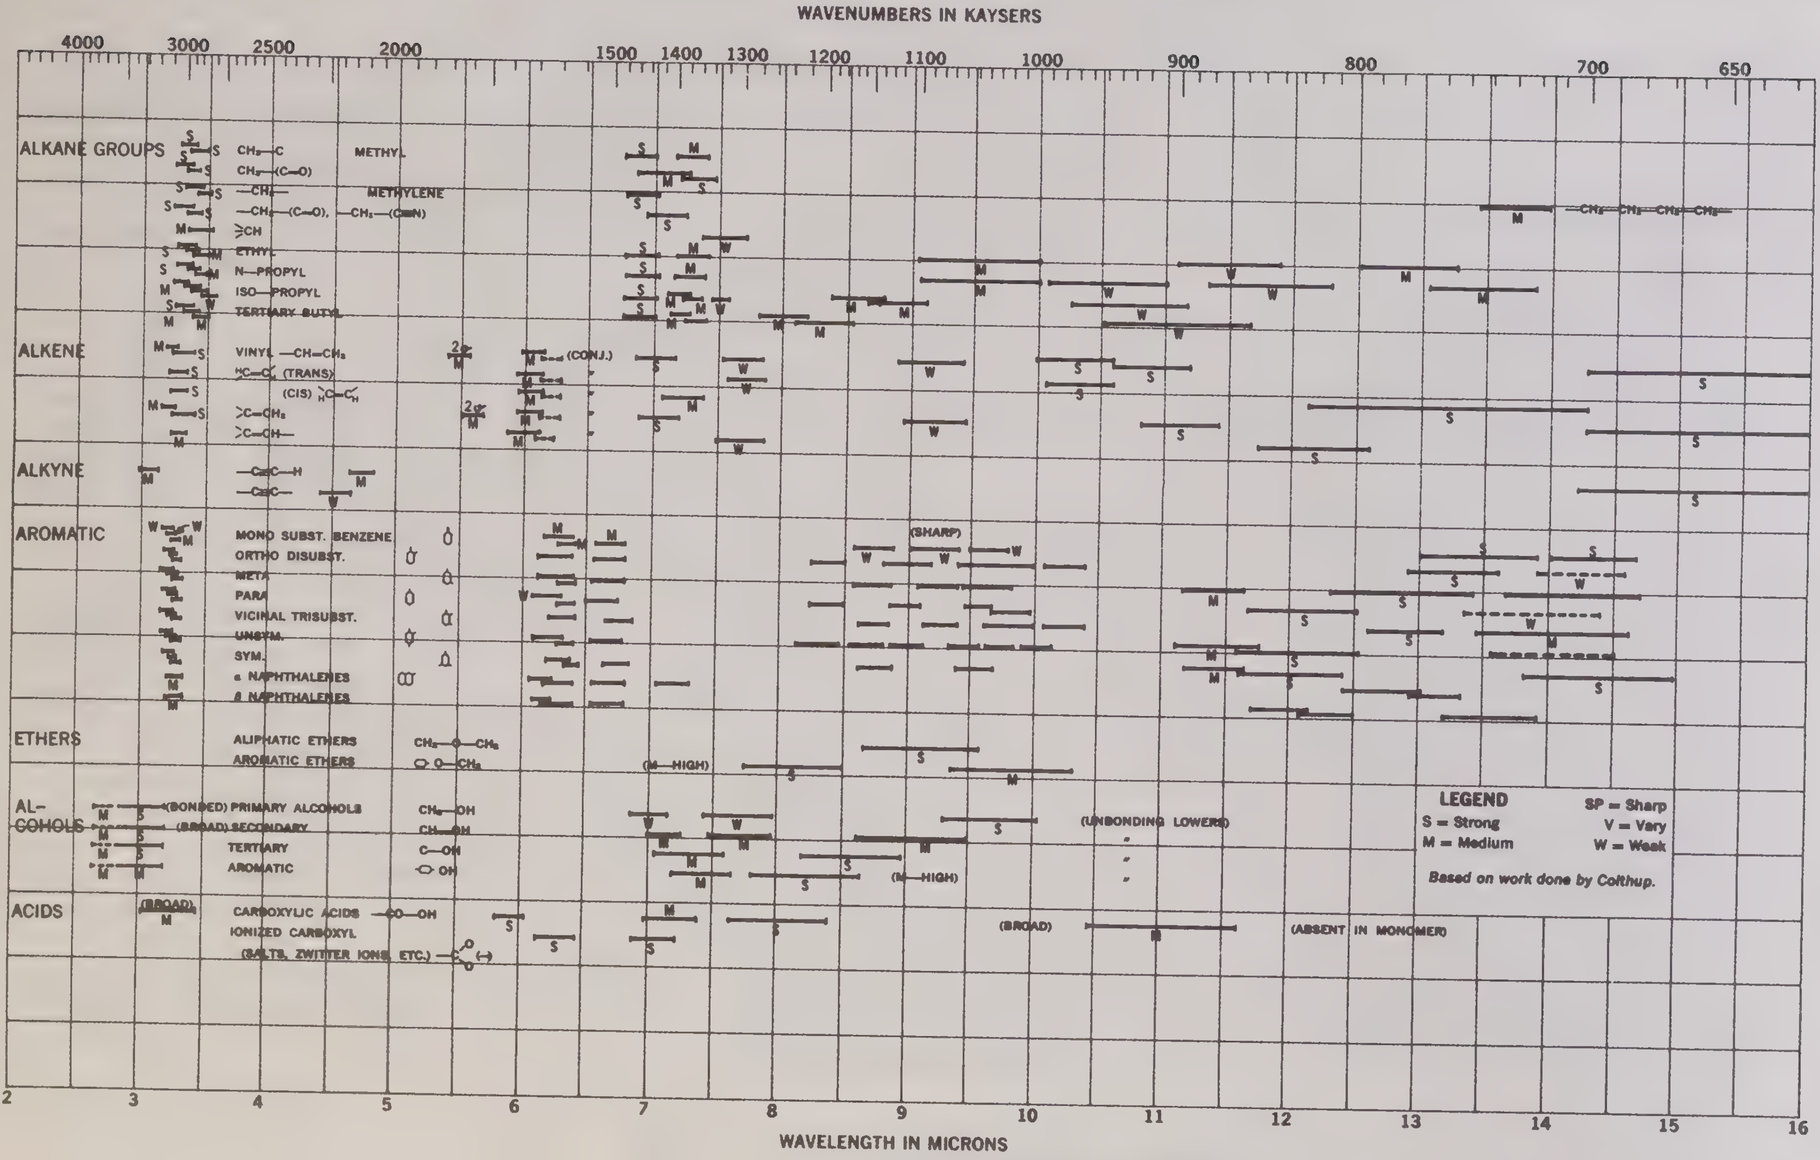
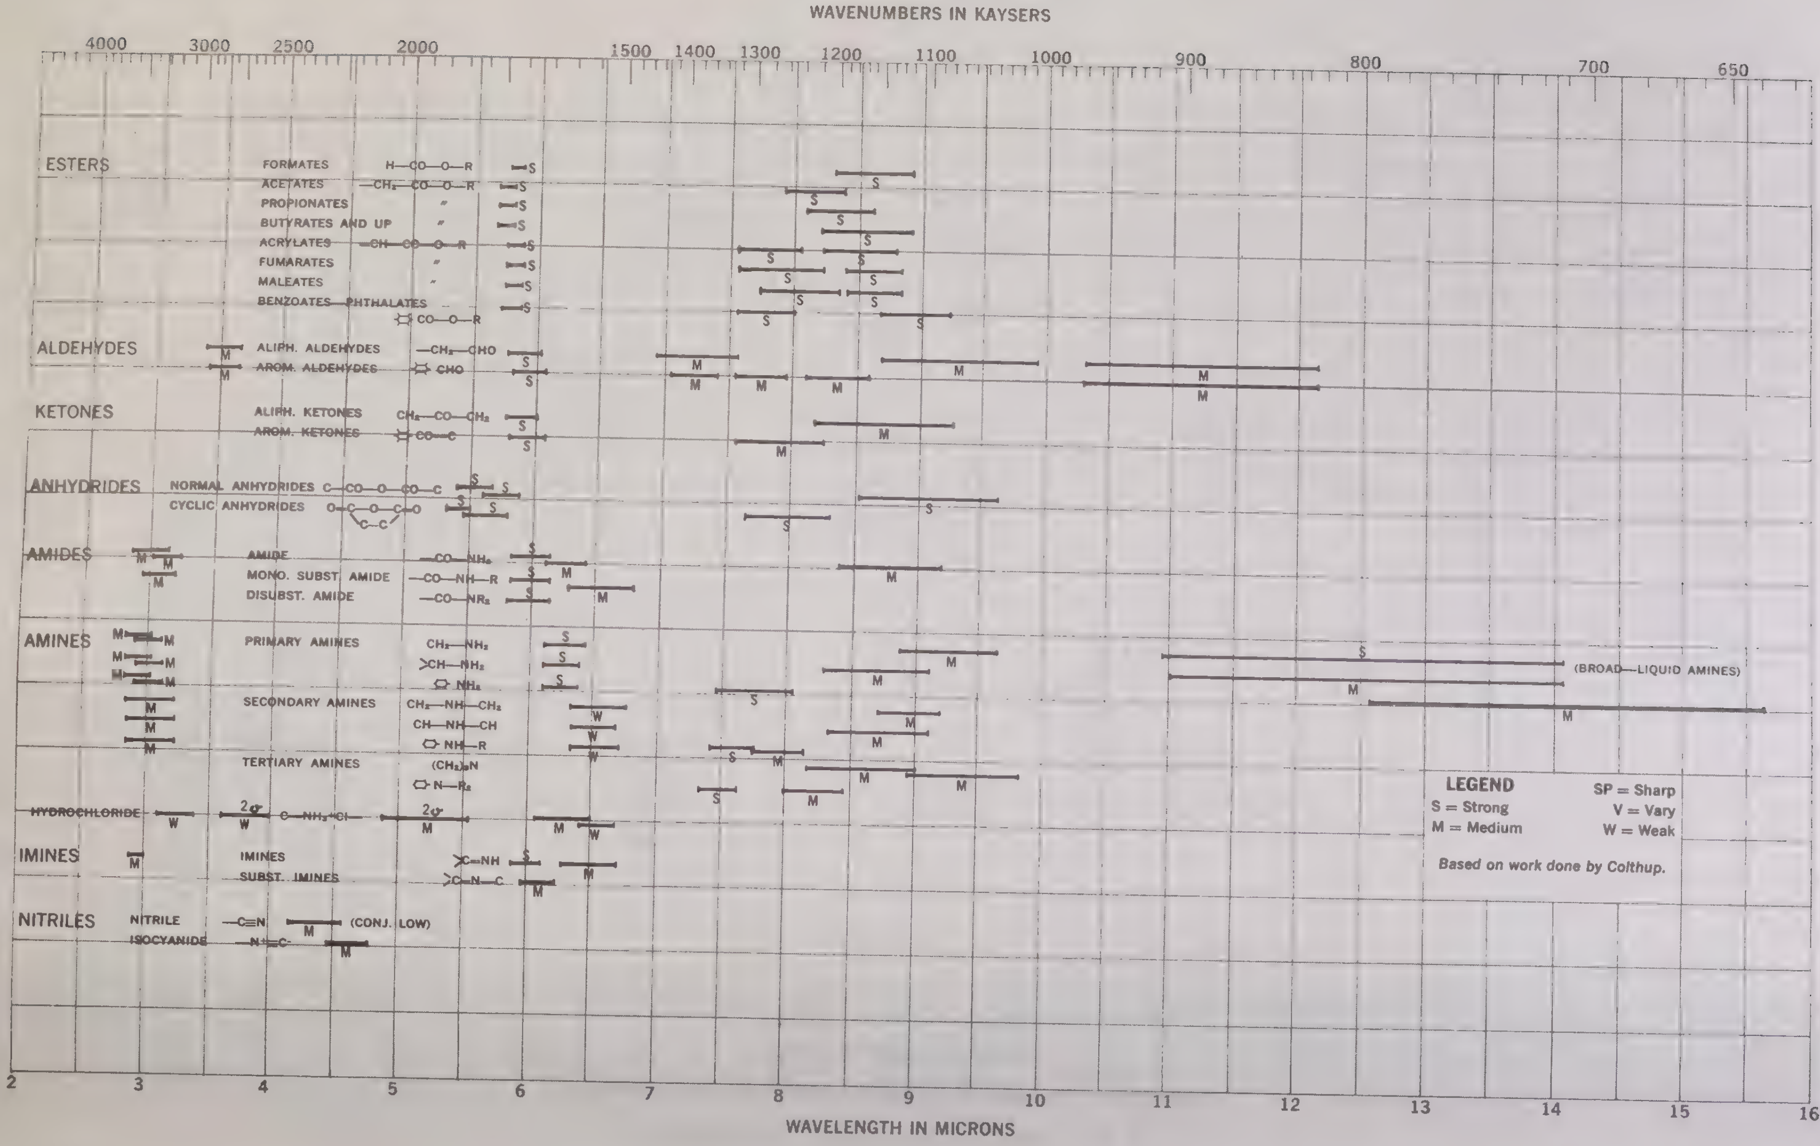
INFRARED CORRELATION CHART No. 1

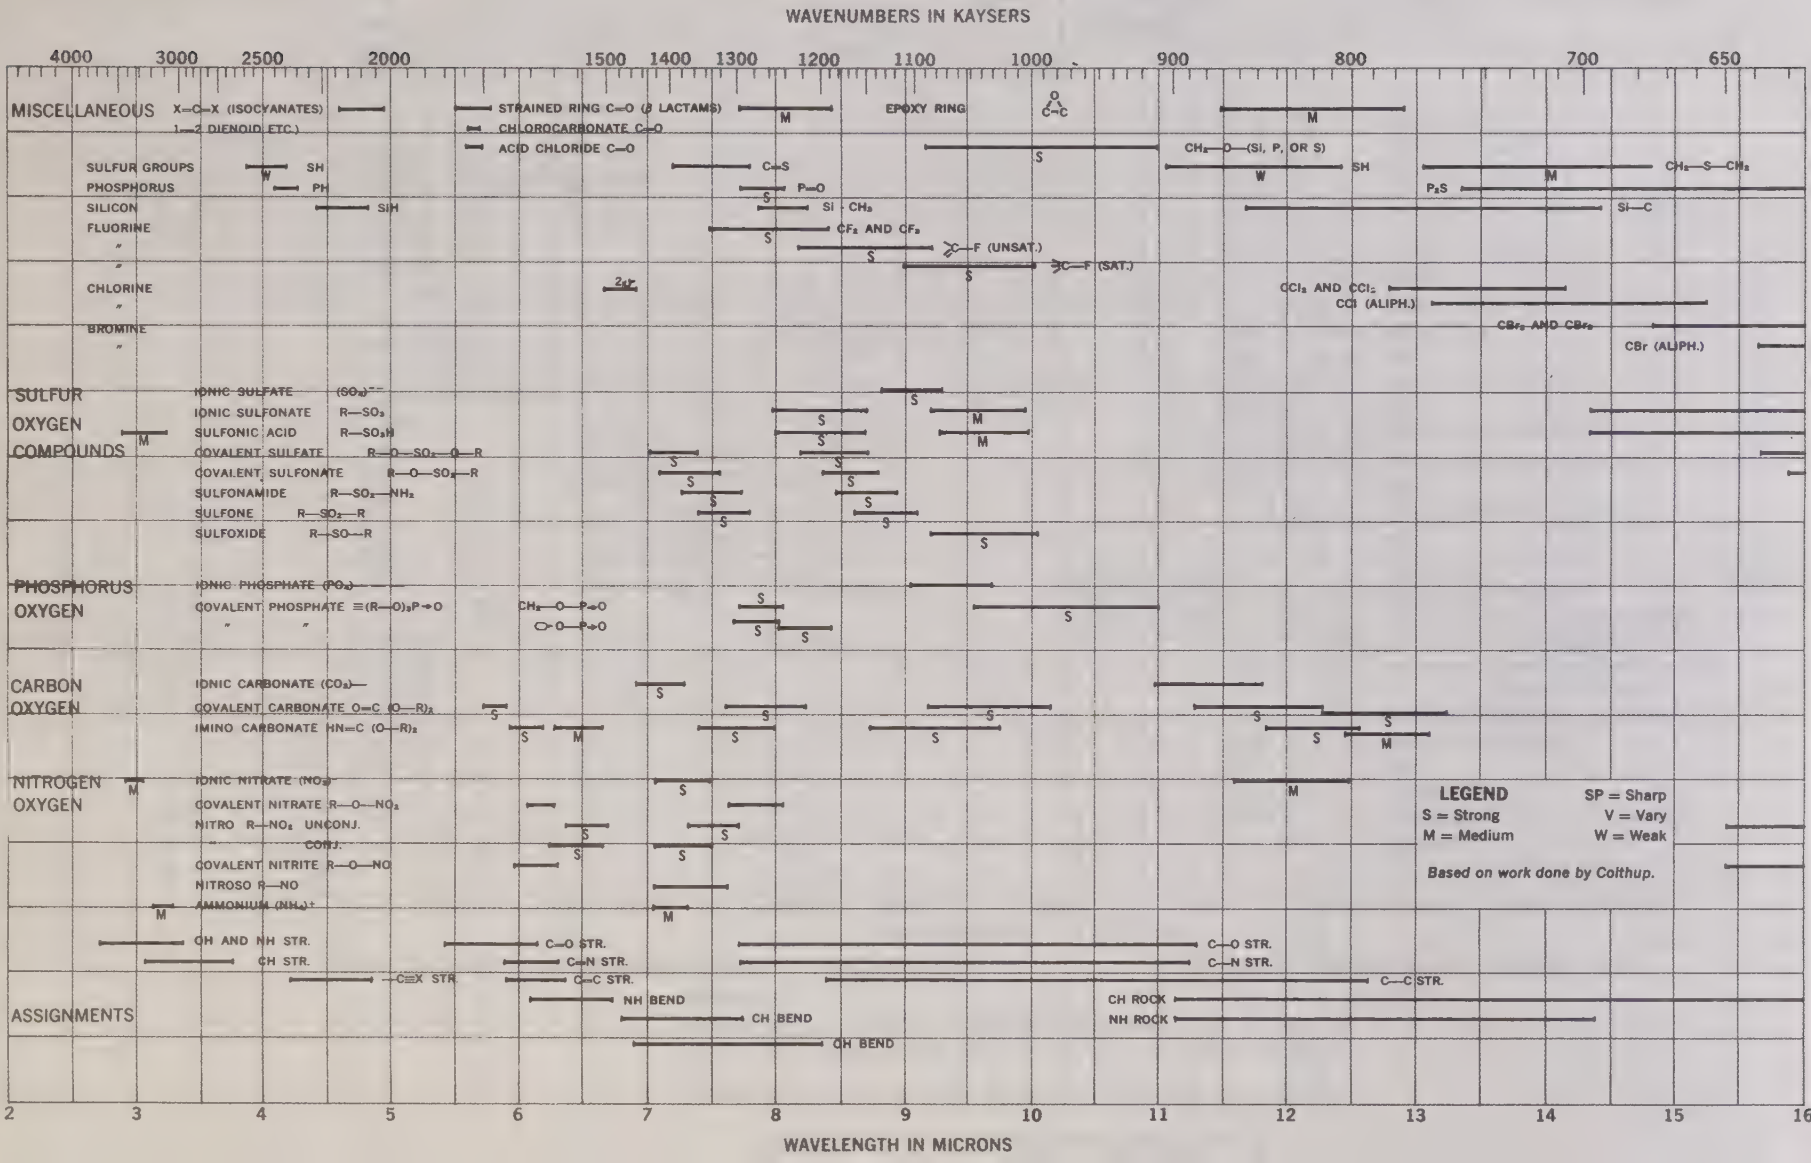
Prepared from information supplied by Beckman Instruments



INFRARED CORRELATION CHART No. 1 (Con't.)



INFRARED CORRELATION CHART No. 1 (Con't.)

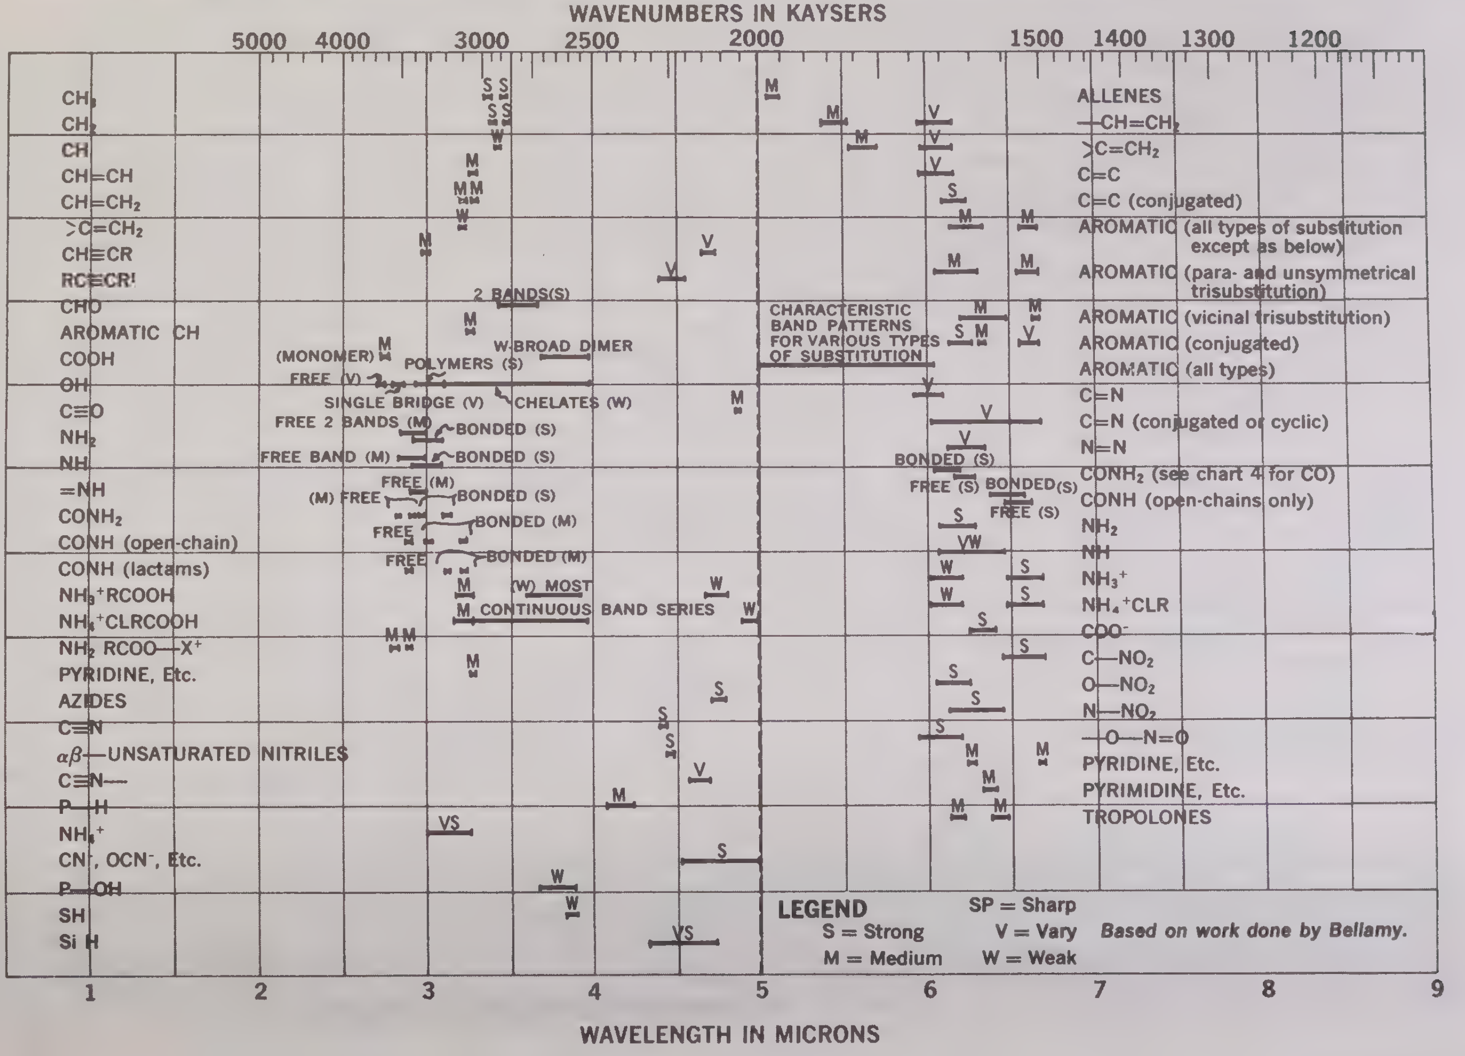


INFRARED CORRELATION CHART No. 2

Prepared from information supplied by Beckman Instruments

This chart presents some information regarding structure, double-bond vibrations, hydrogen stretching and triple-bond vibrations.

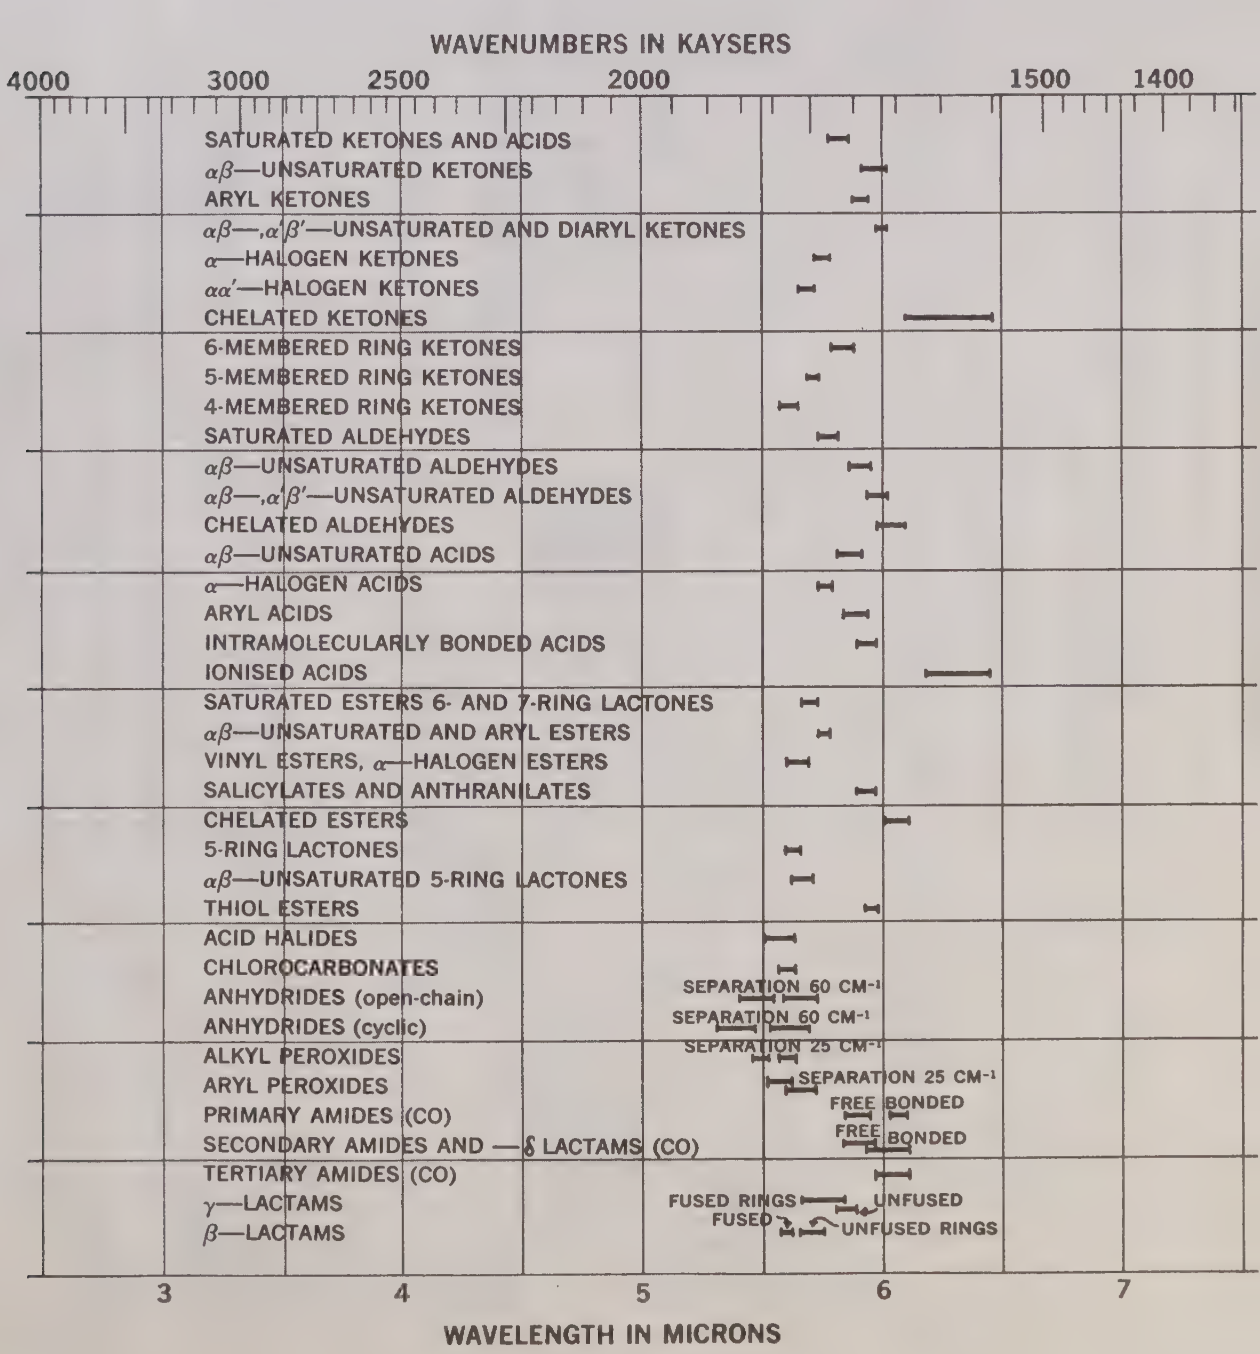
HYDROGEN STRETCHING AND TRIPLE-BOND VIBRATIONS, 3750-2000 CM.$^{-1}$ DOUBLE-BOND VIBRATIONS, ETC. 2000-1500 CM.$^{-1}$



INFRARED CORRELATION CHART No. 3

Prepared from information supplied by Beckman Instruments

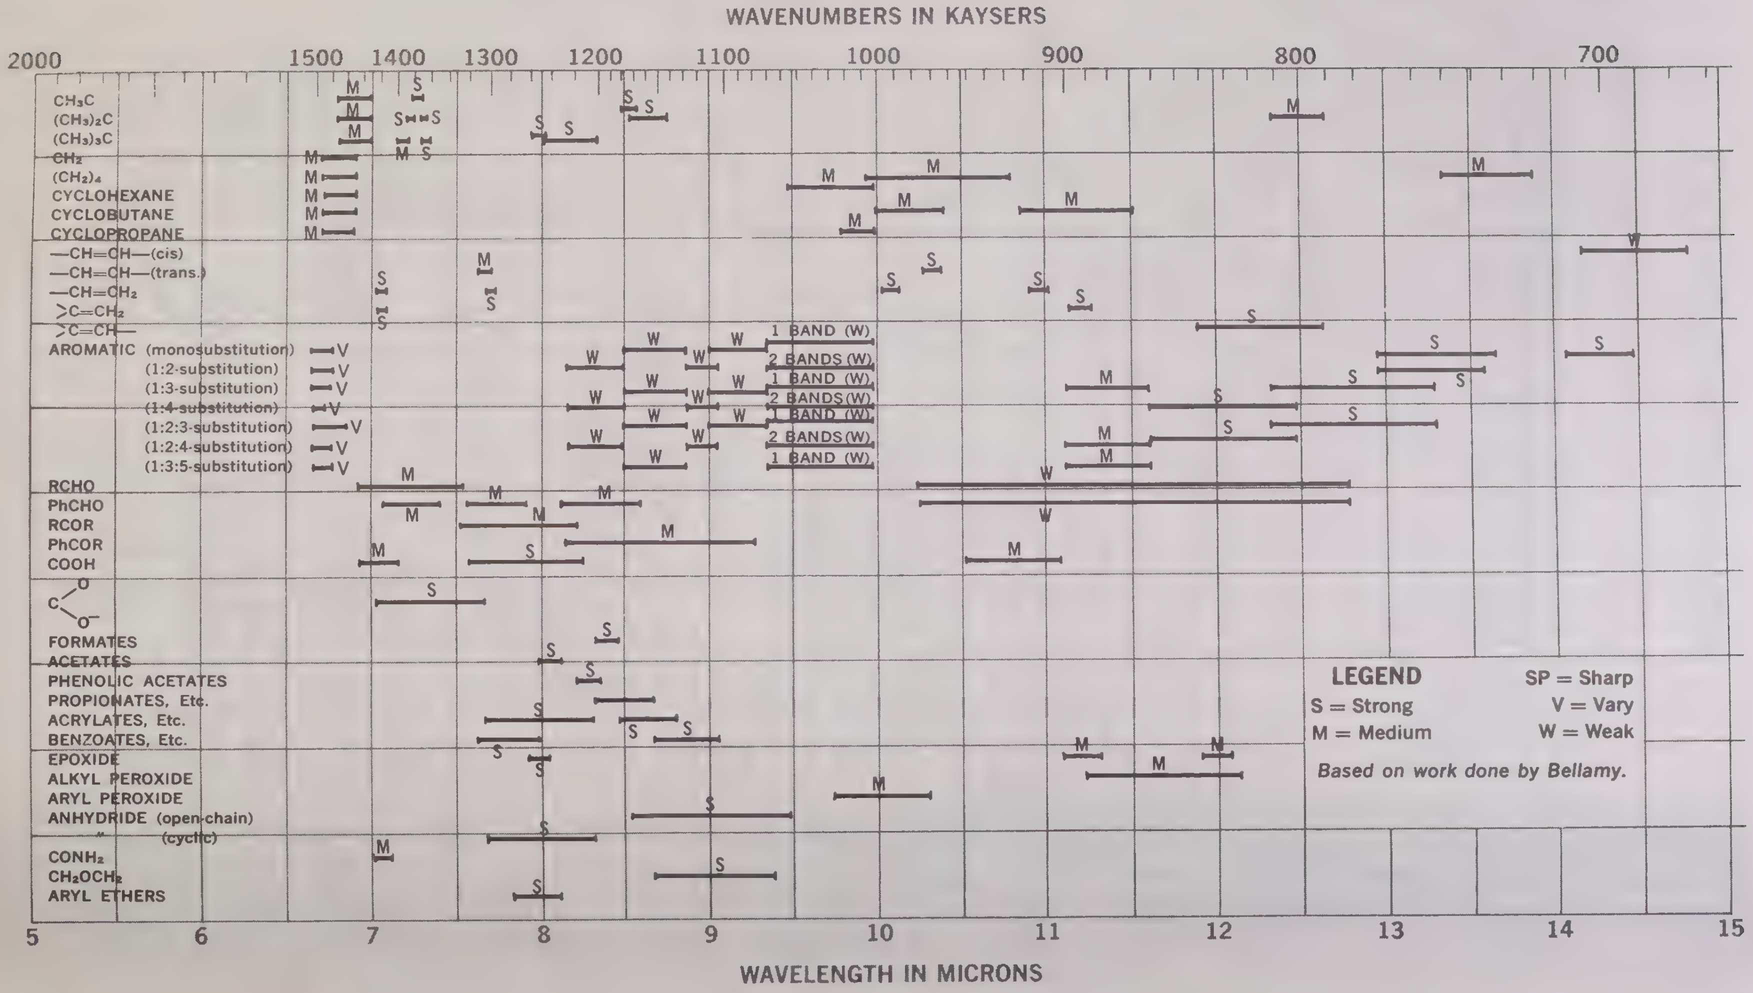
This chart presents some correlations between structure and the carbonyl vibrations of some classes of organic compounds. In all cases the absorption bands are strong and fall within the range of 1900-1500 cm⁻¹.



INFRARED CORRELATION CHART No. 4

Prepared from information supplied by Beckman Instruments

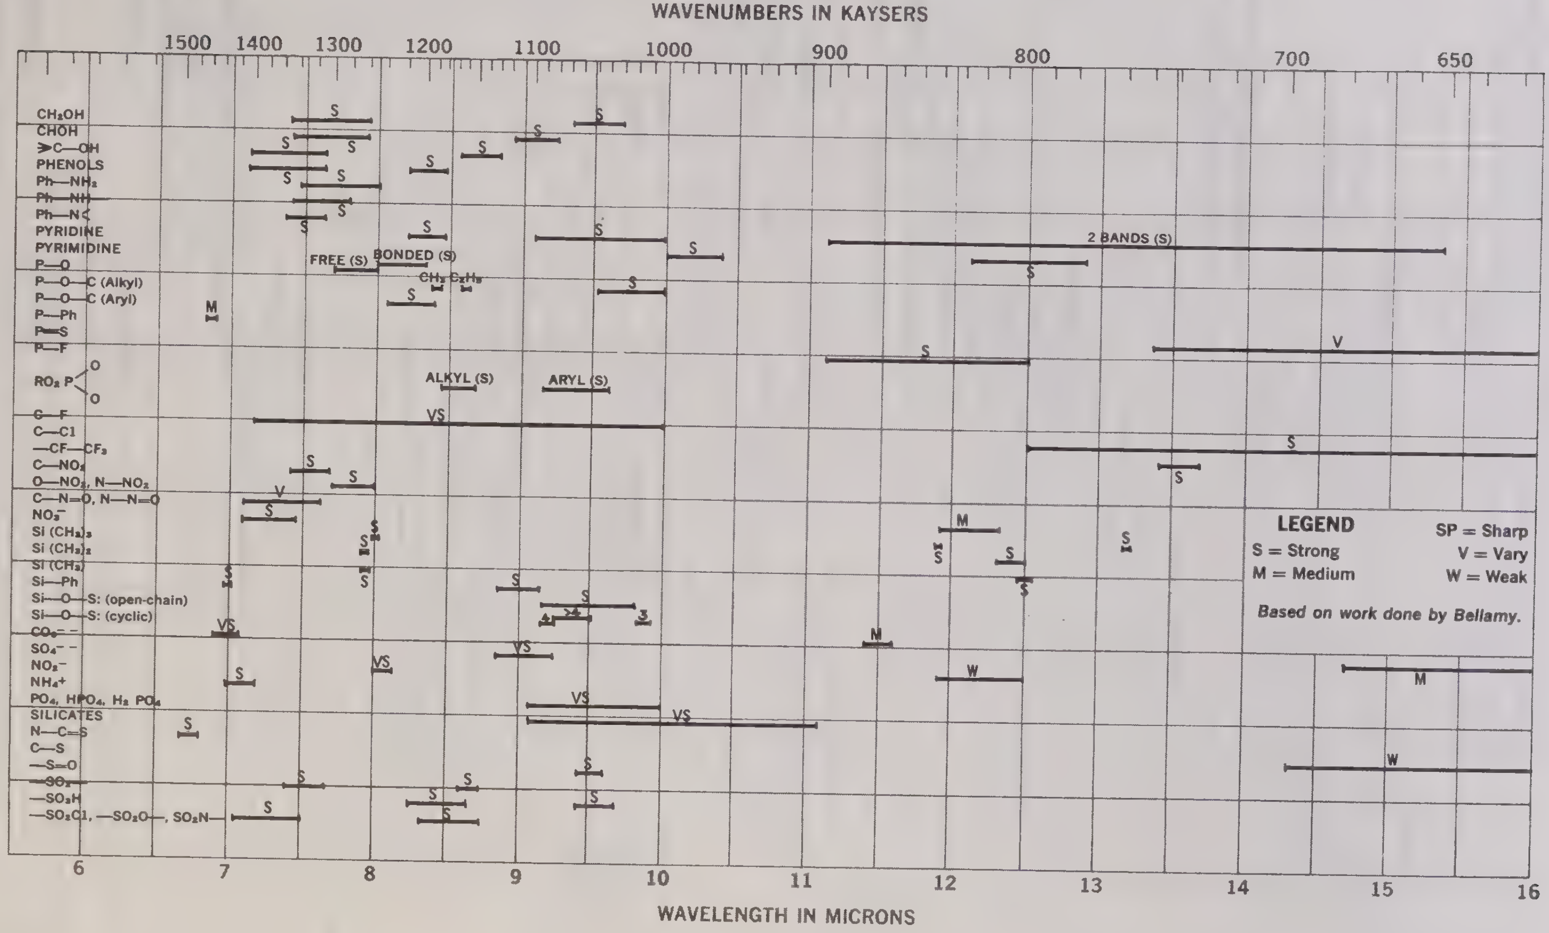
This chart presents some correlations between structure and single-bond vibrations for a number of classes of compounds having absorption between 1500-650 cm⁻¹



INFRARED CORRELATION CHART No. 4 (Con't.)

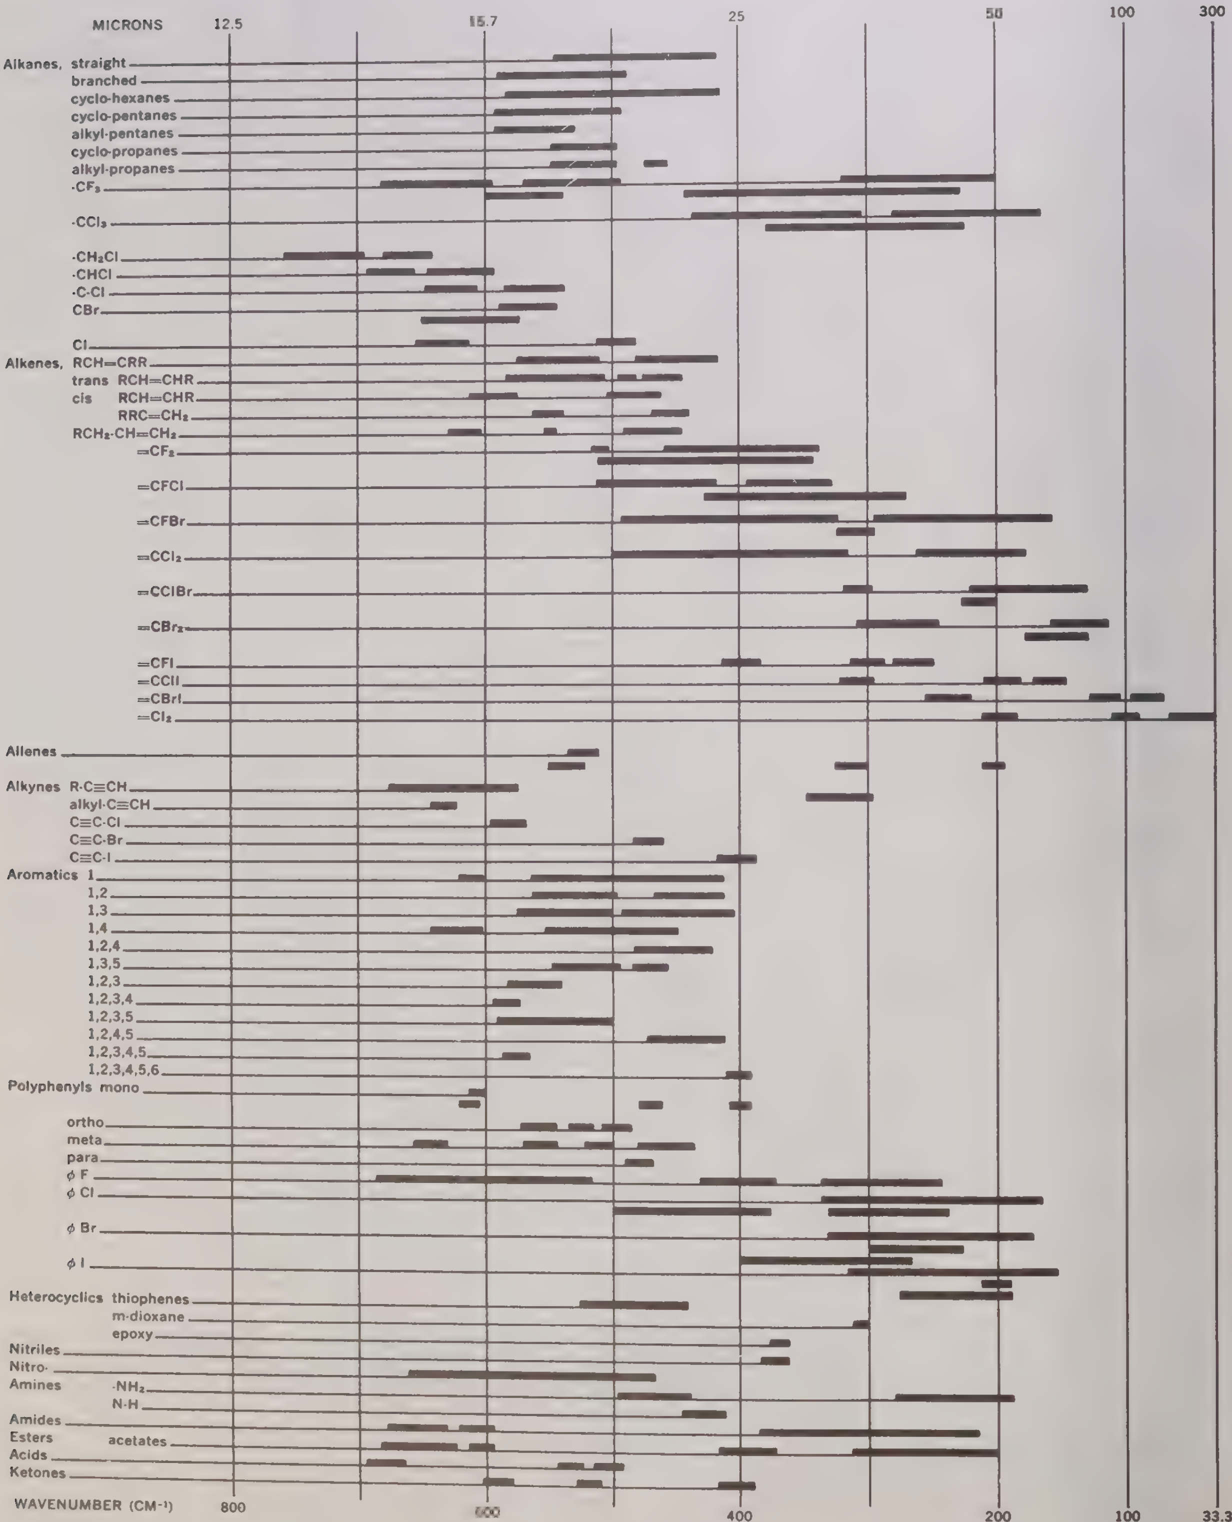
Prepared from information supplied by Beckman Instruments

This chart presents some correlations between structure and single-bond vibrations for a number of classes of compounds having absorption between 1500-650 cm⁻¹.



FAR INFRARED VIBRATIONAL FREQUENCY CORRELATION CHART

Based on evidence compiled by James E. Stewart of Beckman Instruments. This chart shows the vibrational frequency correlation in the far infrared region. Because research is continuing in the far infrared region, this chart is not all-inclusive.



FAR INFRARED VIBRATIONAL FREQUENCY CORRELATION CHART (Con't.)

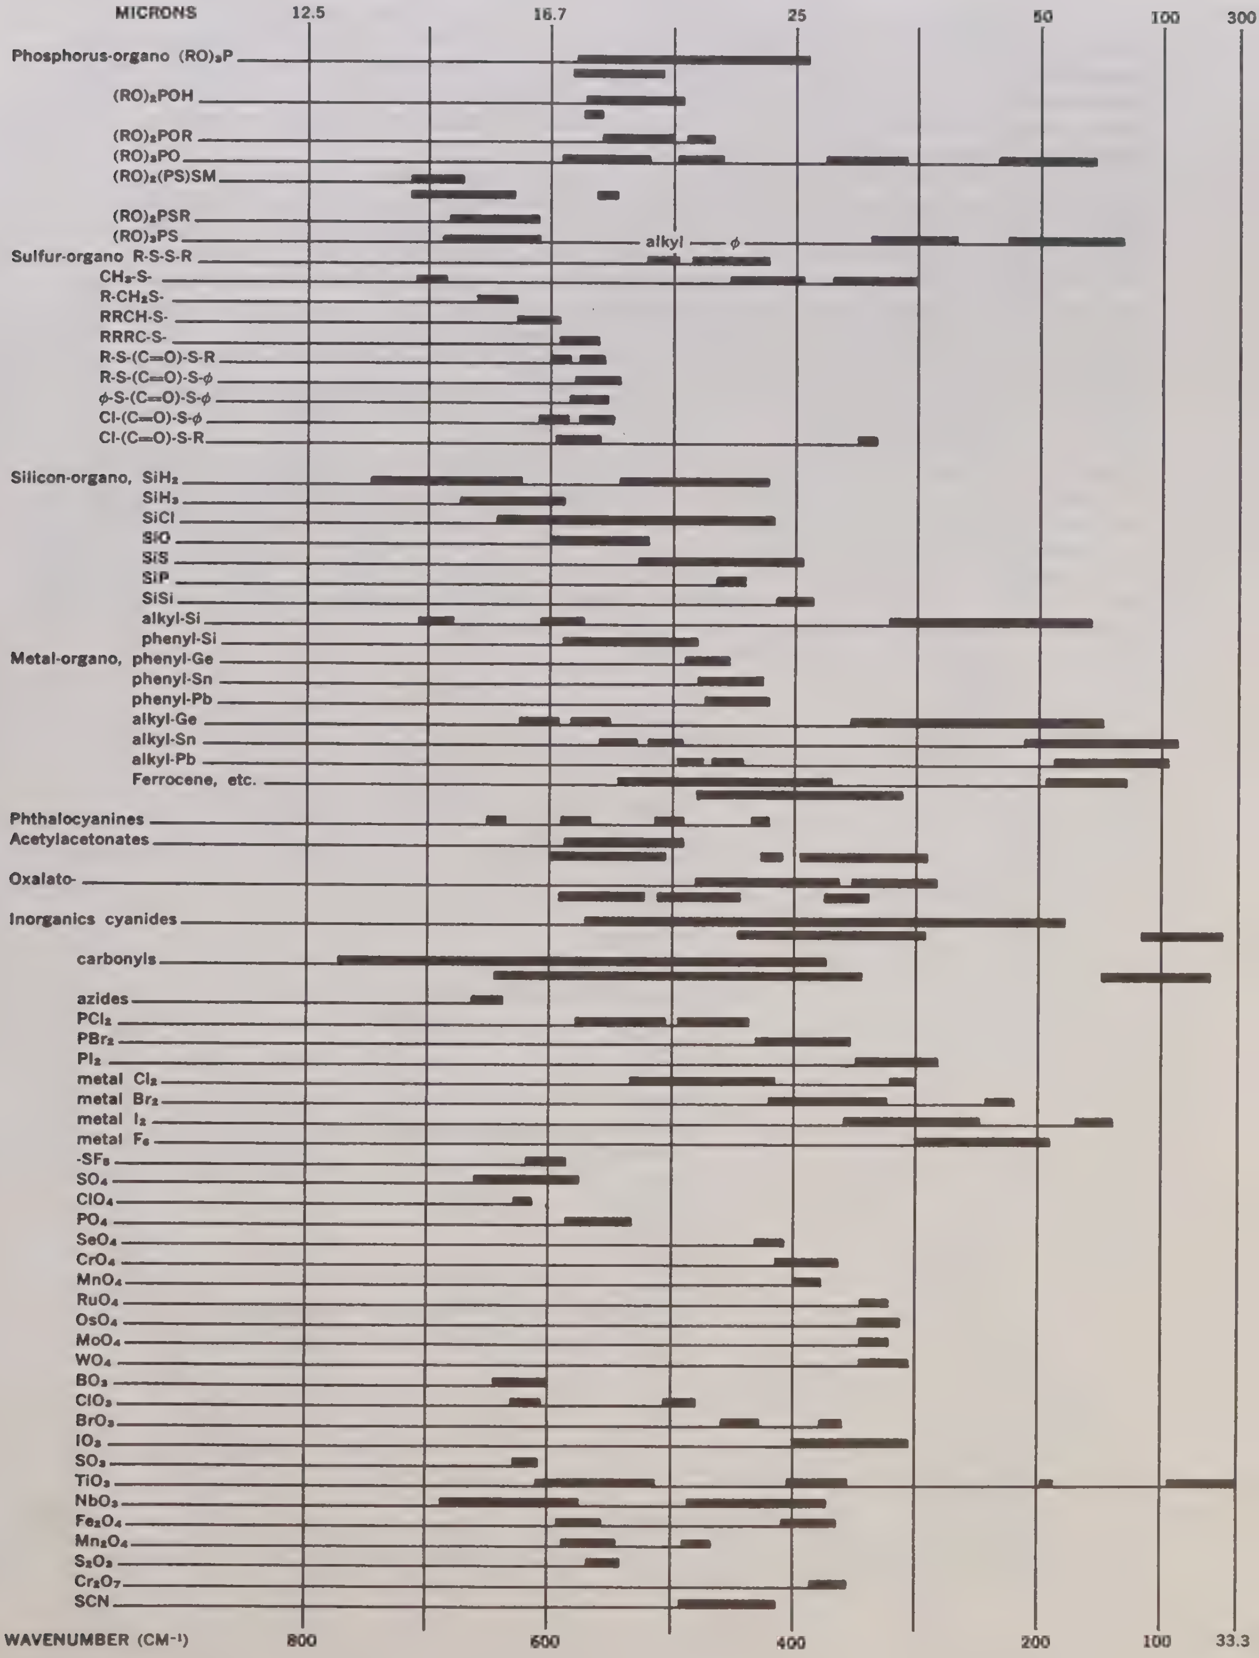


CHART OF CHARACTERISTIC FREQUENCIES BETWEEN ~700–300 cm^{-1}

Freeman F. Bentley, Lee D. Smithson, and Adele L. Rozek

This chart summarizes the characteristic frequencies known to occur between approximately 700–300^{-1}. Those who anticipate using this region of the spectrum should consult "Infrared Spectra and Characteristic Frequencies between ~700–300 cm^{-1}" by Interscience Publishers, a division of John Wiley and Sons, Inc. for a complete discussion of the characteristic frequencies summarized in this chart, a large collection of infrared spectra (700–300 cm^{-1}) of most of the common organic and inorganic compounds, and an extensive bibliography of references to infrared data below ~700 cm^{-1}.

In this chart the black horizontal bars indicate the range of the spectrum in which the characteristic frequencies have been observed to occur in the compounds investigated. The number of compounds investigated is given immediately to the right of the names or structures of the compounds. Obviously those characteristic frequency ranges based upon a limited number of compounds should be used with caution.

The letters above the bars indicate the relative intensities of the absorption bands. These intensities are based upon the strongest band in the spectra (700–300 cm^{-1}) of specific classes of compounds investigated, and they cannot be compared accurately with the intensities given for other classes.

When known, the specific vibration giving rise to the characteristic frequency is printed in abbreviated form immediately to the right of the bar indicating the frequency range except when lack of space prevents this. When there can be no ambiguity, this information may be printed other than to the right. In doubtful cases, arrows are used for clarification.

Naturally, the characteristic frequencies vary in their specificity and analytical value. The user is, therefore, cautioned to use this chart with some reserve. After reviewing this chart, the reader should be aware that there are many characteristic frequencies in the 700–300 cm^{-1} region. Used cautiously, this chart can be of considerable value in the elucidation of structures of unknown compounds.

It is important to emphasize that the region of the infrared between ~700–300 cm^{-1} should be used in conjunction with the more conventional 5000–700 cm^{-1} region. Much of the value of the 700–300 cm^{-1} region can only be realized after interpreting the spectrum between 5000–700 cm^{-1}.

The following symbols and abbreviations are used:

Symbol or Abbreviation	Definition
αCCC	In-plane bending of benzene ring
Antisym.	Antisymmetrical (Asymmetrical)
~	Approximately
β	In-plane bending of ring substituent bond
δ	In-plane bending
γ	Out-of-plane bending
i.p.	In-plane
m	Medium
ν	Stretching
ν_s	Symmetrical stretching
ν_{as}	Antisymmetrical stretching
o.p.	Out-of-plane
$\parallel$	Parallel
$\perp$	Perpendicular
ϕ	Phenyl
ϕCC	Out-of-plane bending of aromatic ring
r	Rocking
s	Strong
sh	Shoulder
Sym.	Symmetrical
v	Variable
w	Weak
"X" Sensitive	An aromatic vibrational mode whose frequency position is greatly dependent on the nature of the substituent.

CHART OF CHARACTERISTIC FREQUENCIES BETWEEN ~ 700–300 cm⁻¹

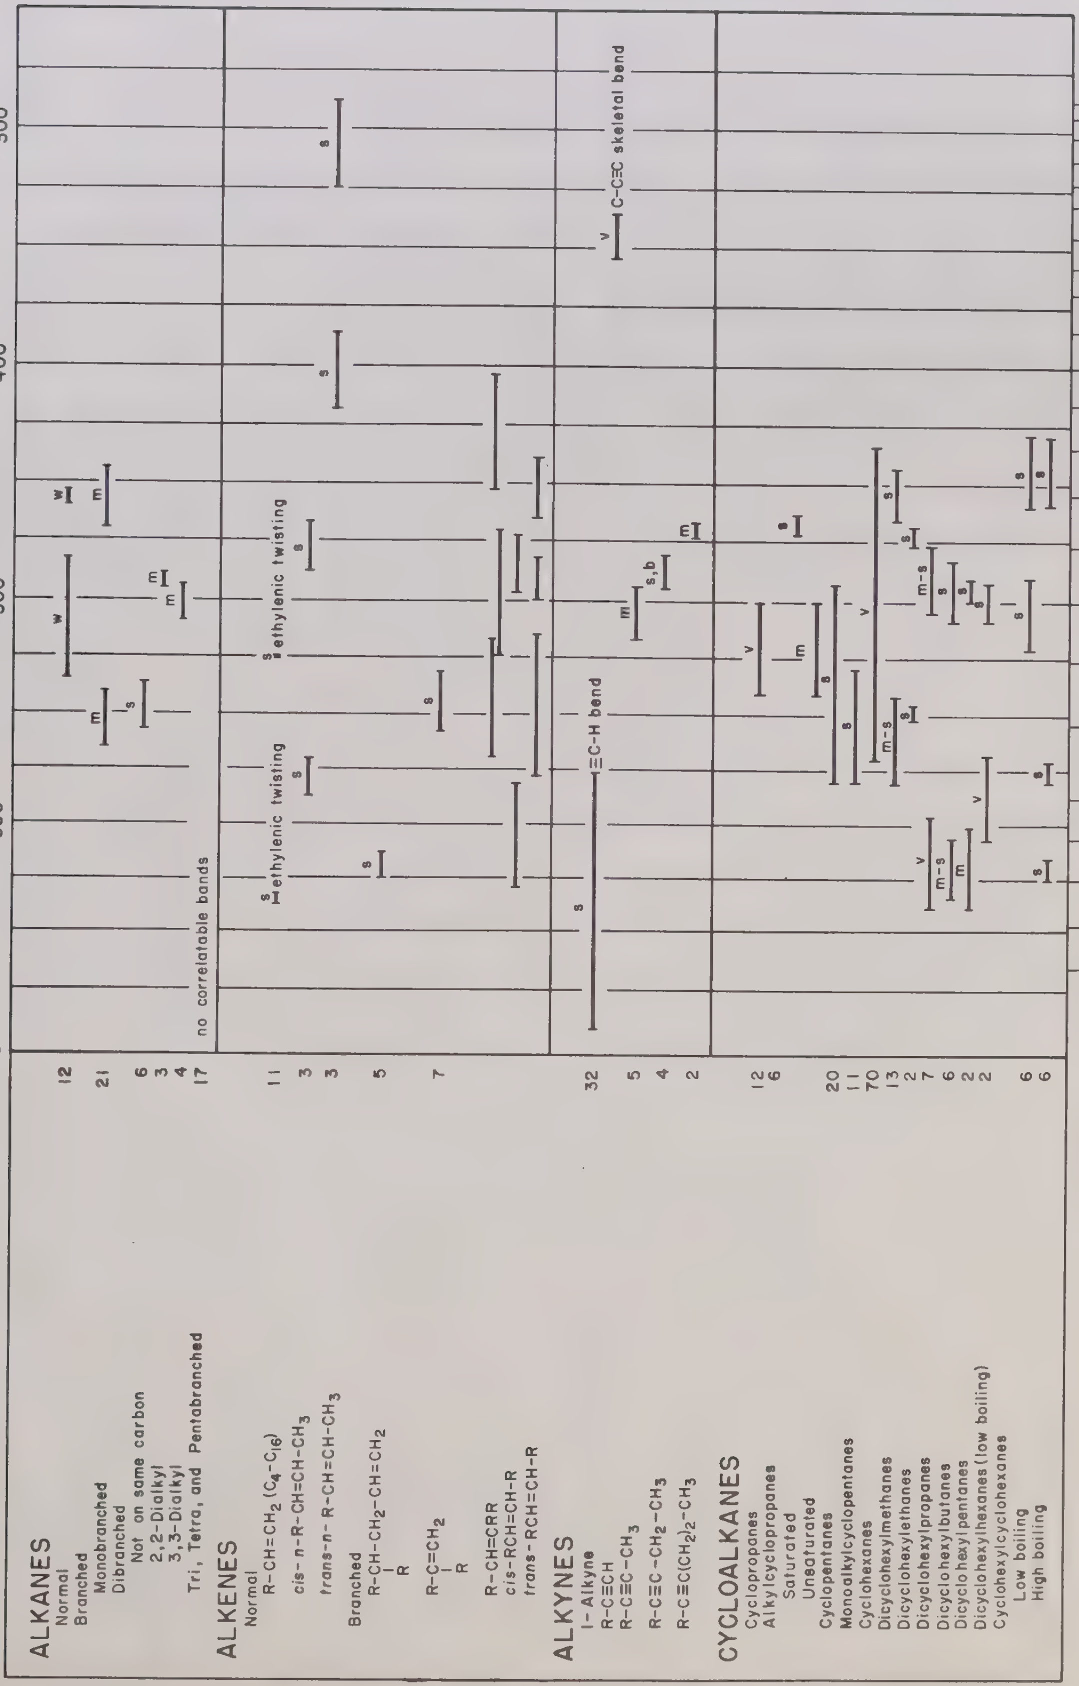

CHART OF CHARACTERISTIC FREQUENCIES BETWEEN ~ 700–300 cm^{-1}

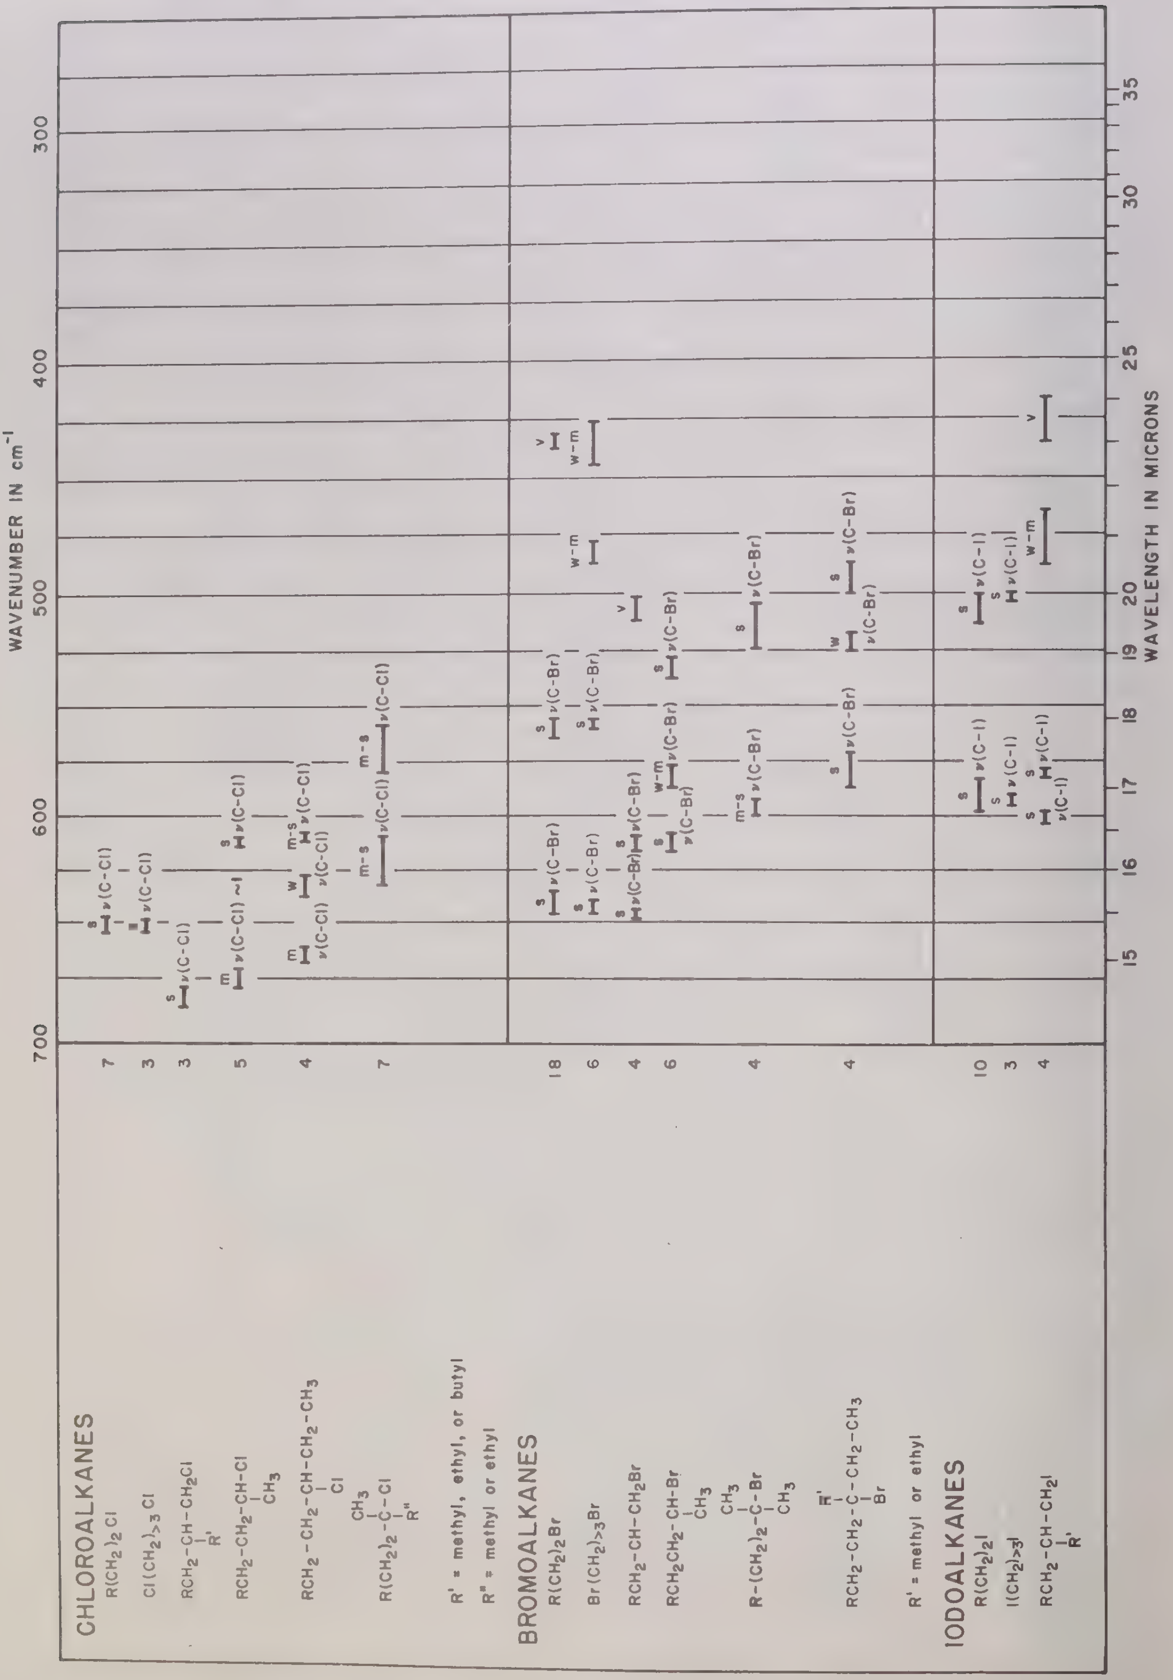

CHART OF CHARACTERISTIC FREQUENCIES BETWEEN ∼ 700–300 cm⁻¹

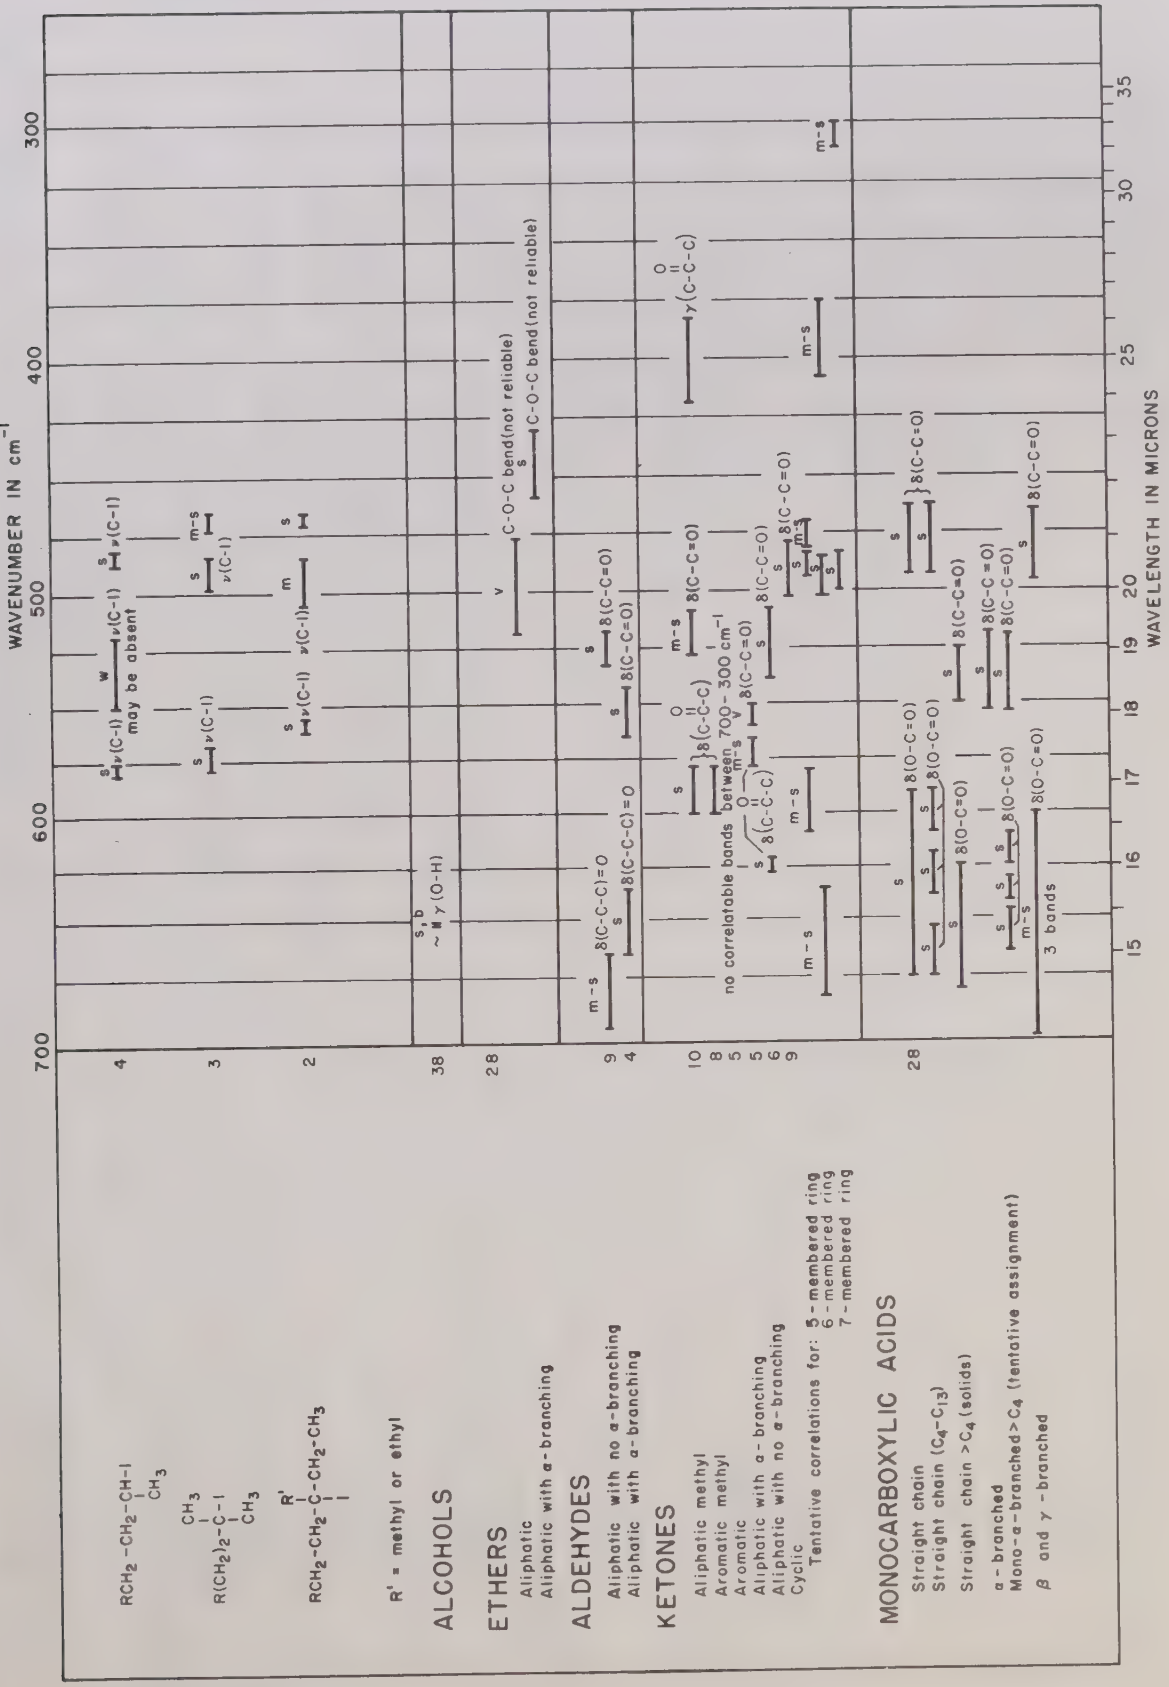

CHART OF CHARACTERISTIC FREQUENCIES BETWEEN $\sim$ 700–300 cm^{-1}

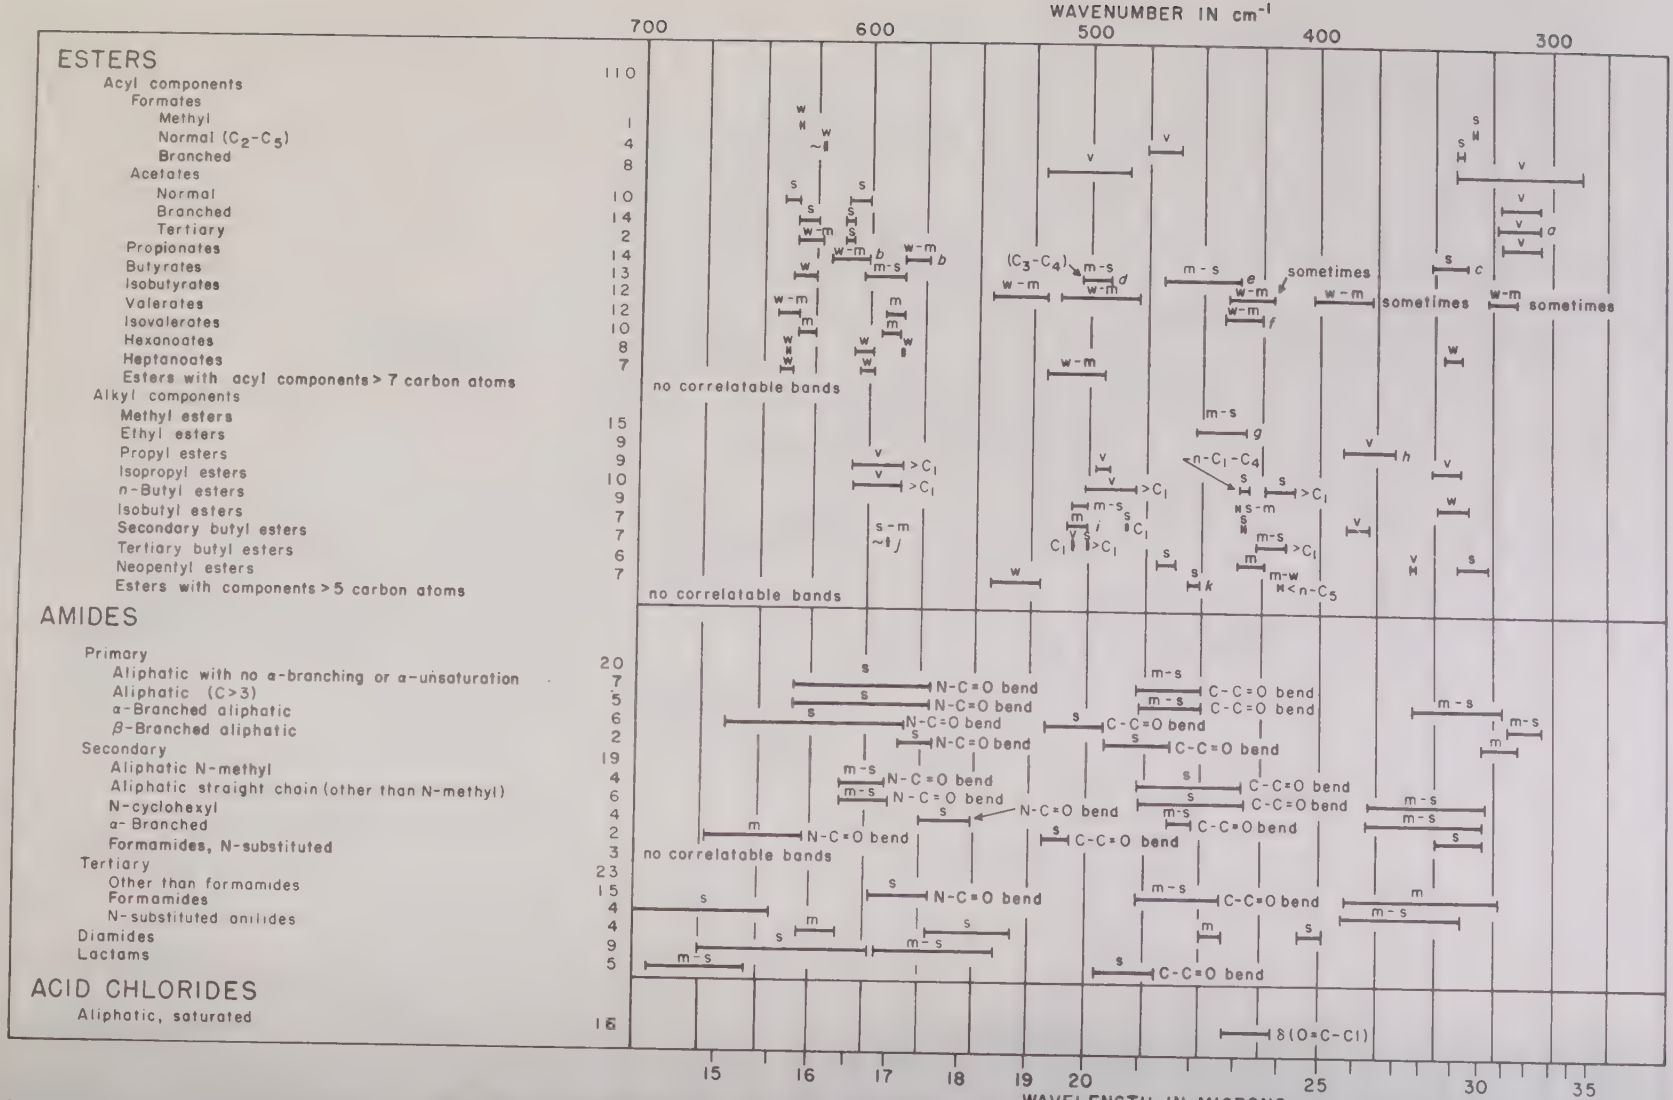

a- Except isopropyl and *sec*-butyl acetate

b- Except isoamyl propionate

c- Except isopropyl and *sec*-butyl propionate

d-Except *t*-butyl butyrate

e-Except propyl butyrate

f-Except isopropyl and sec-butyl valerate

g-Except formate and isobutyrate

h-Difficult to characterize as a class

i-Except formate and isobutyrate

j-Except formate and acetate

k-Except formate and isobutyrate

CHART OF CHARACTERISTIC FREQUENCIES BETWEEN ∽ 700–300 cm⁻¹

CHARACTERISTIC NMR SPECTRAL POSITIONS FOR HYDROGEN IN ORGANIC STRUCTURES

By permission from Erno Mohacsi, J. of Chemical Education, 41, 38 (1964)

This table is useful for quick qualitative determination of proton spectrum lines by providing a tabulation of line positions obtained using tetramethylsilane as an internal reference. The listing has been kept as simple as possible for this purpose. The proton spectrum lines are arranged according to the chemical shift relative to tetramethylsilane and are given in values of τ and δ. The purpose of this table is to supplement tables available in standard references and to summarize information available in the literature.

Stable Particle Table *(cont'd)*

→ Indicates an entry in the Stable Particle Data Card Listings not entered in the Stable Particle Table. We do not regard these as established particles.

*S = Scale factor = $\sqrt{\chi^2/(N-1)}$, where N ≈ number of experiments. S should be ≈ 1. If S > 1, we have enlarged the error of the mean, $\delta\bar{x}$; i.e., $\delta\bar{x} \to S\delta\bar{x}$. This convention is still inadequate, since if S >> 1 the experiments are probably inconsistent, and therefore the real uncertainty is probably even greater than $S\delta x$. See text, and ideograms in Stable Particle Data Card Listings.

a. The baryon number B, strangeness S, and charm C of the hadrons which appear in the tables are as follows:

Mesons (B=0)	S	C	Baryons (B=1)	S	C
π,η	0	0	p,n	0	0
K^+,K^0	+1	0	Λ,Σ	−1	0
$K^-,\bar{K}^0$	−1	0	Ξ	−2	0
D^+,D^0	0	+1	Ω^-	−3	0
$D^-,\bar{D}^0$	0	−1			

b. Quoted upper limits correspond to a 90% confidence level.

c. In decays with more than two bodies, p_{max} is the maximum momentum that any particle can have.

d. For simplicity, decay mode charge states are written for the particle shown. For antiparticle modes all particles must be charge conjugated.

e. See Stable Particle Data Card Listings for energy limits used in this measurement.

f. Quantum numbers shown are favored but not yet established. See Data Card Listings.

g. Theoretical value; see also Stable Particle Data Card Listings.

h. See note in Stable Particle Data Card Listings.

i. The direct emission branching fraction is $(1.56\pm.35)\times10^{-5}$.

j. The $\tau(K^0_S)$ and $|\eta_{+-}|$ averages (and the related $K^0_L \to \pi^+\pi^-$ branching fraction and rate averages) contain only post-1971 results. The pre-1971 averages were $|\eta_{+-}| = (1.95\pm0.03)\times10^{-3}$ and $\tau(K^0_S) = (0.862\pm0.006)\times10^{-10}$ sec. See notes on $|\eta_{+-}|$ and $\tau(K^0_S)$ discrepancies in Stable Particle Data Card Listings.

k. The branching fraction for $K^0_L \to \pi e\nu$ includes the radiative events $K^0_L \to \pi e\nu\gamma$.

l. Error does not include 0.13% uncertainty in the absolute SPEAR energy calibration. Assumes m_ψ=3095 MeV.

m. This is a weighted average of $D^{\pm}$ and D^0 branching fractions with undetermined weighting.

n. P for Ξ and J^P for Ω^- not yet measured. Values reported are SU(3) predictions.

o. Assumes rate for $\Xi^- \to \Sigma^0 e^-\nu$ small compared with $\Xi^- \to \Lambda e^-\nu$.

p. Warning. This is an average of two incompatible results: ABCLV collaboration $(1.41^{+0.15}_{-0.24})\times10^{-10}$ sec and ACNO collaboration $(0.75^{+0.14}_{-0.11})\times10^{-10}$ sec. See note in Data Card Listings.

q. $|g_A/g_V|$ defined by $g_A^2 = |C_A|^2+|C'_A|^2$, $g_V^2 = |C_V|^2+|C'_V|^2$, and $\Sigma\langle\bar{e}|\Gamma_i|\mu\rangle\langle\bar{\nu}|\Gamma_i(C_i+C'_i\gamma_5)|\nu\rangle$; ϕ defined by $\cos\phi = -\mathrm{Re}(C_A^*C'_V+C'_AC_V^*)/g_Ag_V$ [for more details, see text Section VI A].

r. The definition of the slope parameter of the Dalitz plot is as follows [see also text Section VI B.1]:

$$|M|^2 = 1 + g\left(\frac{s_3-s_0}{m^2_{\pi^+}}\right) .$$

s. The $K^0_S \to \pi\pi$ and $K^0_L \to \pi\pi$ rates (and branching fractions) are from independent fits and do not include results of K^0_L–K^0_S interference experiments. The $|\eta_{+-}|$ and $|\eta_{00}|$ values given in the addendum are these rates combined with the $|\eta_{+-}|$ and $|\eta_{00}|$ results from interference experiments.

t. The definition for the CP violation parameters is as follows [see also text Section VI B.3]:

$$\eta_{+-} = |\eta_{+-}|e^{i\phi_{+-}} = \frac{A(K^0_L \to \pi^+\pi^-)}{A(K^0_S \to \pi^+\pi^-)} \qquad \eta_{00} = |\eta_{00}|e^{i\phi_{00}} = \frac{A(K^0_L \to \pi^0\pi^0)}{A(K^0_S \to \pi^0\pi^0)}$$

$$\delta = \frac{\Gamma(K^0_L\to\ell^+)-\Gamma(K^0_L\to\ell^-)}{\Gamma(K^0_L\to\ell^+)+\Gamma(K^0_L\to\ell^-)}, \quad |\eta_{+-0}|^2 = \frac{\Gamma(K^0_S\to\pi^+\pi^-\pi^0)^{\text{CP viol.}}}{\Gamma(K^0_L\to\pi^+\pi^-\pi^0)}, \quad |\eta_{000}|^2 = \frac{\Gamma(K^0_S\to\pi^0\pi^0\pi^0)^{\text{CP viol.}}}{\Gamma(K^0_L\to\pi^0\pi^0\pi^0)} .$$

u. The definition of these quantites is as follows [for more details on sign convention, see text Section VI B]:

$\alpha = \dfrac{2\|s\|\|p\|\cos\Delta}{\|s\|^2+\|p\|^2}$	$\beta = \sqrt{1-\alpha^2}\sin\phi$	g_A/g_V defined by $\langle B_f\|\gamma_\lambda(g_V-g_A\gamma_5)\|B_i\rangle$
$\beta = \dfrac{-2\|s\|\|p\|\sin\Delta}{\|s\|^2+\|p\|^2}$	$\gamma = \sqrt{1-\alpha^2}\cos\phi$	δ defined by $g_A/g_V = \|g_A/g_V\|e^{i\delta}$

Meson Table

April 1978

In addition to the entries in the Meson Table, the Meson Data Card Listings contain all substantial claims for meson resonances. See Contents of Meson Data Card Listings below.

Quantities in italics are new or have changed by more than one (old) standard deviation since April 1976.

Meson Table *(cont'd)*

→ Indicates an entry in Meson Data Card Listings not entered in the Meson Table. We do not regard these as established resonances. All the entries in the Listings can be found in the Table of Contents of Meson Data Card Listings.

¶ See Meson Data Card Listings.

* Quoted error includes scale factor $S = \sqrt{\chi^2/(N-1)}$. See footnote to Stable Particle Table.

† Square brackets indicate a subreaction of the previous (unbracketed) decay mode(s).

§ This is only an educated guess; the error given is larger than the error of the average of the published values. (See Meson Data Card Listings for the latter.)

(a) ΓM is approximately the half-width of the resonance when plotted against M^2.

(b) For decay modes into ≥ 3 particles, p_{max} is the maximum momentum that any of the particles in the final state can have. The momenta have been calculated by using the averaged central mass values, without taking into account the widths of the resonances.

(c) From pole position $(M - i\Gamma/2)$.

(d) The e^+e^- branching ratio is from $e^+e^- \to \pi^+\pi^-$ experiments only. The $\omega\rho$ interference is then due to $\omega\rho$ mixing only, and is expected to be small. See note in Meson Data Card Listings. The $\mu^+\mu^-$ branching ratio is compiled from 3 experiments; each possibly with substantial $\omega\rho$ interference. The error reflects this uncertainty; see notes in Meson Data Card Listings. If $e\mu$ universality holds, $\Gamma(\rho^0 \to \mu^+\mu^-) = \Gamma(\rho^0 \to e^+e^-) \times 0.99785$.

(e) Empirical limits on fractions for other decay modes of $\rho(770)$ are $\pi^\pm\eta < 0.8\%$, $\pi^+\pi^+\pi^-\pi^- < 0.15\%$, $\pi^\pm\pi^+\pi^-\pi^0 < 0.2\%$.

(f) Empirical limits on fractions for other decay modes of $\omega(783)$ are $\pi^+\pi^-\gamma < 5\%$, $\pi^0\pi^0\gamma < 1\%$, η + neutral(s) $< 1.5\%$, $\mu^+\mu^- < 0.02\%$, $\pi^0\mu^+\mu^- < 0.2\%$.

(g) Empirical limits on fractions for other decay modes of $\eta'(958)$: $\pi^+\pi^- < 2\%$, $\pi^+\pi^-\pi^0 < 5\%$, $\pi^+\pi^+\pi^-\pi^- < 1\%$, $\pi^+\pi^+\pi^-\pi^-\pi^0 < 1\%$, $6\pi < 1\%$, $\pi^+\pi^-e^+e^- < 0.6\%$, $\pi^0e^+e^- < 1.3\%$, $\eta e^+e^- < 1.1\%$, $\pi^0\rho^0 < 4\%$.

(h) The mass and width are from the $\eta\pi$ mode only. If the $K\bar{K}$ channel is strongly coupled, the width may be 300 MeV or more.

(i) Empirical limits on fractions for other decay modes of $\phi(1020)$ are $\pi^+\pi^- < 0.03\%$, $\pi^+\pi^-\gamma < 0.7\%$, $\omega\gamma < 5\%$, $\rho\gamma < 2\%$, $2\pi^+2\pi^-\pi^0 < 1\%$.

(j) Empirical limits on fractions for other decay modes of B(1235): $\pi\pi < 15\%$, $K\bar{K} < 2\%$, $4\pi < 50\%$, $\phi\pi < 1.5\%$, $\eta\pi < 25\%$, $(\bar{K}K)^\pm\pi^0 < 8\%$, $K_SK_S\,\pi^\pm < 2\%$, $K_SK_L\,\pi^\pm < 6\%$.

(k) Empirical limits on fractions for other decay modes of f'(1515) are $\eta\eta < 50\%$, $\eta\pi\pi < 30\%$, $K\bar{K}\pi + K^*\bar{K} < 35\%$, $2\pi^+2\pi^- < 32\%$.

(ℓ) Empirical limits on fractions for other decay modes of f(1270) are $\eta\pi\pi < 1\%$, $K^0K^-\pi^+$ + c.c. $< 1\%$, $\eta\eta < 2\%$.

Established Nonets, and octet-singlet mixing angles from Appendix IIB, Eq. (2'). Of the two isosinglets, the "mainly octet" one is written first, followed by a semicolon.

$(J^P)C_n$	Nonet members	$\theta_{lin.}$	$\theta_{quadr.}$
$(0^-)+$	π, K, η; η'	-24 ± 1°	-11 ± 1°
$(1^-)-$	ρ, K^*, ϕ; ω	38 ± 1°	40 ± 1°
$(2^+)+$	A_2, $K^*(1430)$, f'; f	24 ± 2°	26 ± 2°

Baryon Table

April 1978

The following short list gives the status of all the Baryon States in the Data Card Listings. In addition to the status, the name, the nominal mass, and the quantum numbers (where known) are shown. States with three- or four-star status are included in the main Baryon Table; the others have been omitted because the evidence for the existence of the effect and/or for its interpretation as a resonance is open to considerable question.

Baryon Table *(cont'd)*

→ For convenience all Baryon States for which information exists in the Baryon Data Card Listings are listed at the beginning of the Baryon Table. States with only a one or two star (*) rating in that list have been omitted from the main Baryon Table; each omitted state is indicated by an arrow in the left-hand margin of the Table. In the Listings there is an arrow under the name of each state omitted from the Table.

a. The names of the Baryon States in Col. 1 [such as N(1470)] contain a nominal mass which is primarily for purposes of identification. See Col. 4 for actual mass values. The convention for using primes in the spectroscopic notation for the quantun numbers in Col. 2 (such as P'_{11}) is as follows: no prime is attached when the Data Card Listings include only one resonance in the given partial wave; when there is more than one resonance the first has been designated with a prime, the second with a double prime, etc. The name and the quantum numbers for each state are also given in large print at the beginning of the Data Card Listings for that state. See footnote a. of the Stable Particle Table for the strangeness quantum numbers of the baryons; in addition to the names listed there, we also use N and Δ for $S = 0$ baryons, and Z^* for $S = +1$ baryons.

b. The numbers in Col. 3 and Col. 6 are calculated using the nominal mass (see *a.* above) for M and the nominal width (see *c.* below) for Γ.

c. For masses, widths, and branching fractions of most baryons we report here a range instead of an average. Averages are appropriate if each result is based on independent measurements, but inappropriate where the spread in parameters arises because different models or procedures have been applied to a common set of data. The ranges given in the Table are generally chosen to be *conservatively large*. See the Data Card Listings for the individual values obtained in specific analyses. A single value with an approximation sign (~) indicates that there is not enough data to give a meaningful interval. A nominal width is included in parentheses in Col. 5; this nominal width is used to calculate the value of ΓM given in Col. 6.

d. For two-body decay modes we given the momentum, p, of the decay products in the decaying baryon rest frame. For decay modes into ≥3 particles we give the maximum momentum, p_{max}, that any of the particles in the final state can have in this frame. The momenta are calculated using the nominal mass (see *a.* above) of the decaying baryon, and of any isobars in the final state. Some decays which would be energetically forbidden for the nominal masses actually occur because of the finite widths of the decaying baryon and/or isobars in the final state. In these cases, the decay momentum is omitted from Col. 9 and replaced with a reference to this footnote.

e. Square brackets around an isobar decay mode indicate that it is a sub-reaction of the previous unbracketed decay mode.

f. Many of the branching fractions in the Table are extracted from significantly more accurate results on $\sqrt{xx'}$ type couplings obtained in partial-wave analyses. The original $\sqrt{xx'}$ values are given in the Baryon Data Card Listings. For information on radiative decays of N's and Δ's, see the mini-review preceding the Baryon Data Card Listings.

g. Only information coming from partial-wave analyses has been used here. For the production experiment results see the Baryon Data Card Listings.

h. The range given here does not include the widths of several hundred MeV reported by LONGACRE 75 and LONGACRE 77.

i. The range given here does not include the branching ratio of approximately 80% reported by FELTESSE 75.

j. The existence of an $I_{1\,11}$ resonance at this mass has been confirmed, but the possibility remains that there are also other nearby $I = 1/2$ resonances. See the mini-review preceding the Baryon Data Card Listings.

k. This state has been seen only in an energy-dependent fit to total, channel, or fixed angle cross-section data. J is not known; x is Γ_{el}/Γ.

l. See note on determination of resonance parameters in the Baryon Data Card Listings. Values of mass and width are dependent upon resonance shape used to fit the data. The pole position is much less dependent upon the parametrization used. The pole positions given here are taken from results (in the Data Card Listings) of fits to the phase shifts of CARTER 73 without Coulomb corrections.

m. There may be more than one P_{33} resonance in or near this mass range.

n. There is probably more than one Δ resonance near 2160 MeV. The parameters in the Table correspond to the observations of REY 74. See the Baryon Data Card Listings for other possibilities.

o. The error given here is only an educated guess; it is larger than the error of the average of the published values (see the Baryon Data Card Listings for the latter).

p. Quoted error includes a S (scale) factor. See second footnote to Stable Particle Table.

q. Because the elastic branching fraction of this resonance is poorly determined, it is not possible to extract inelastic branching fractions from partial-wave couplings. See the Baryon Data Card Listings for the partial-wave couplings.

r. Recent partial-wave analyses of the College de France-Saclay group find evidence for a $5/2^-$ and a $9/2^-$ Σ resonance at this mass. See the Baryon Data Card Listings.

s. This state is now considered to be firmly established even though the quantum numbers and decay rates are not sufficiently well known.

CHARACTERISTICS OF PARTICLES AND PARTICLE DISPERSOIDS

Institute Journal, Vol. 5, p.95
(Third Quarter, 1961)

ABBREVIATIONS AND SYMBOLS

Abbreviations

The following list of abbreviations is intended to cover those in common use in chemistry and physics. Symbols are presented in a separate list following the abbreviations.

A.	Acre
Å	Ångström unit
a	Are
a.	Acid
abs.	Absolute
abt.	About
a.c.	Alternating current
acet.	Acetone
acet. a.	Acetic acid
al.	Alcohol
alk.	Alkali
alt.	Altitude
amal.	Amalgam; amalgamated
amor. *or* amorph.	Amorphous
amp.	Ampere
anh.	Anhydrous
antilog	Antilogarithm
ap.	Apothecaries'
appr.	Approximately
aq.	Aqua; aqueous; water
aq. reg.	Aqua regia
asym.	Asymmetrical
atm. *or* atmos.	Atmosphere (atmospheric)
At. No.	Atomic number
At. Wt.	Atomic weight
aux.	Auxiliary
Av.	Average
av. *or* avoir.	Avoirdupois
bar.	Barometer
bbl.	Barrel
bd.	Board
Bé	Beaumé (degrees)
B.G.	Birmingham gauge (hoop and sheet)
b.h.p.	Brake horse power
bl.	Blue
blk.	Black
B.M.	Board measure
b.p.	Boiling point
br.	Brown
BTU	British thermal unit
bu.	Bushel
B.W.G.	Birmingham wire gauge
bz.	Benzene
C	Centigrade
c	Carat; centi-
c.	Cold
ca	Candle
ca.	*Circa*, about; approximately
cal.	Calorie (gram)
cc. *or* c.c.	Cubic centimeter
cd.	Cord
c. cm	Cubic centimeter
Cent.	Centigrade
centi-	Prefix meaning 1/100
cf.	*Confer*, compare
c.f.m.	Cubic foot per minute
cgs	Centimeter-gram-second system of units
cgse	Cgs electrostatic system
cgsm	Cgs electromagnetic system
ch.	Chain
chl.	Chloroform
cir.	Circular
circum.	Cirumference
cl	Centiliter
cm	Centimeter
cm^2	Square centimeter
cm^3	Cubic centimeter
c.m.	Circular mil
coef.	Coefficient
colog	Cologarithm
colorl.	Colorless
comm'l	Commercial
conc.	Concentrated
cond.	Condensing
const.	Constant
cos	Cosine
cos^{-1}	Arc or angle whose cosine is...; anticosine of; inverse cosine of
cosec	Cosecant
cosh	Hyperbolic cosine
cosh^{-1}	Inverse hyperbolic cosine
cot	Cotangent
cot^{-1}	Arc or angle whose cotangent is . . .
coth	Hyperbolic cotangent
coth^{-1}	Inverse hyperbolic cotangent
covers	Coversed sine
c.p.	Candle power; circular pitch; center of pressure
cry. *or* cryst.	Crystalline; crystals
csc	Cosecant
csc^{-1}	Arc or angle whose cosecant is...
csch	Hyperbolic cosecant
csch^{-1}	Inverse hyperbolic cosecant
CTU	Centigrade thermal unit
cu.	Cubic
cu. cm	Cubic centimeter
cu. ft.	Cubic foot
cu. in.	Cubic inch
cu. m	Cubic meter
cu. yd.	Cubic yard
cwt.	Hundredweight
cyl.	Cylinder
d	Derivative; deci-
d.	Decomposes; day
d.	Dextrorotary
d.c.	Direct current
dec.	Decomposes
deci-	Prefix meaning 1/10
def.	Definition (s)
deg	Thermometric degree; absolute C unless contrary is indicated
deka-	Prefix meaning 10
deliq.	Deliquescent
den. *or* dens.	Density
dg	Decigram
diam.	Diameter
dil.	Dilute
dissd.	Dissolved
dk	Deka-
dk.	Dark
dkg.	Dekagram
dkl	Dekaliter
dkm	Dekameter
dkm^2	Square dekameter
dkm^3	Cubic dekameter
dks	Dekastere
dl	Deciliter
dm	Decimeter
dm^2	Square decimeter
dm^3	Cubic decimeter
d.p.	Diametral pitch; double pole
dr.	Dram
dr. ap. *or* ʒ ap.	Dram, apothecaries'
dr. av. *or* ʒ av.	Dram, avoirdupois
dr. fl. *or* ʒ fl.	Dram, fluid
dr. t. *or* ʒt.	Dram, troy
ds	Decistere
dwt.	Pennyweight
efflor.	Efflorescent
e.g.	*Exempli gratia*, for example
e.h.p.	Effective horse power
E.L.	Elastic limit
em	Cgsm unit of quantity of electricity
emf *or* e.m.f.	Electromotive force
es	Electrostatic or cgse unit of quantity of electricity
etc.	*Et. cetera*, and so forth
eth.	Ether
eth. acet.	Ethyl acetate
et. seq.	*Et sequentes*, and the following
evap.	Evaporation
ex.	Excess
exp	Exponential function
exp.	Explodes
exsec	Exterior secant
F	Fahrenheit
f.	From
fahr.	Fahrenheit
fath.	Fathom
feath.	Feathery
f.h.p.	Friction horse power
fir.	Firkin
fl.	Fluid
fl. dr.	Dram, fluid
fl. oz.	Ounce, fluid
fluores.	Fluorescent
fps	Foot-pound-second system of units
fpse	Foot-pound-second electrostatic system
fpsm	Foot-pound-second electromagnetic system
F.S.	Factor of safety
ft.	Foot
ft.^{2}	Square foot
ft.^{3}	Cubic foot
ft.-lb.	Foot-pound
fur.	Furlong
G	Gravitation constant
g	Gram
g-cal. *or* g.-cal.	Gram calorie
gal.	Gallon
gel.	Gelatinous
gi.	Gill
glac.	Glacial
glit.	Glittering
glyc.	Glycerine
gm.	Gram
gr.	Gray; grain
grn.	Green
gyr.	Gyration
h	Hecto-
h.	Hot; hour
ha	Hectare
hecto-	Prefix meaning 100
hex.	Hexagonal
hg	Hectogram
hhd.	Hogshead
hl	Hectoliter
hm	Hectometer
hm^2	Square hectometer
hm^3	Cubic hectometer
hor. *or* horiz.	Horizontal
h.-p.	High-Pressure
HP *or* h.p.	Horse power
h.p.-hr.	Horse power-hour
hr.	Hour
hyg.	Hygroscopic
i.	Insoluble
ibid.	*Ibidem*, in the same place
i.e.	*Id est*, that is
ign.	Ignites
i.h.p.	Indicated horse power
in.	Indigo; inch
in.^{2}	Square inch
in.^{3}	Cubic inch
inc.	Inclusive
in.-lb.	Inch-pound
insol.	Insoluble
Int.	International
iso.	Isotropic
isom.	Isometric
isoth.	Isothermal
k	Kilo-
kg	Kilogram
kg-cal.	Kilogram-calorie
kg-m	Kilogram-meter
kilo-	Prefix meaning 1,000
kl	Kiloliter
km	Kilometer
km^2	Square kilometer
km^3	Cubic kilometer
kva.	Kilovolt-ampere
kw.	Kilowatt
kw.-hr.	Kilowatt-hour
l	Liter
l.	Long
l	Laevorotary
lat.	Latitude
lb.	Pound
lb. ap.	Pound, apothecaries'
lb. av.	Pound, avoirdupois
lb. t.	Pound, troy
leaf.	Leaflets
lgr.	Ligroin
li.	Link
lin.	Linear
liq.	Liquid
lim.	Limit
ln	Natural hyperbolic or Napierian logarithm
log *or* log.	Logarithm
log$_e$	Logarithm to the base *e*; natural, hyperbolic or Napierian logarithm
log$_{10}$	Common logarithm; logarithm to the base 10
long.	Longitude
lng.	Long
l.-p.	Low-pressure
lt.	Light
lust.	Lustrous
♏	Minim or drop
m	Meter; milli-
m^2	Square meter
m^3	Cubic meter
m.	Minute
m.	Meta-
max.	Maximum
med.	Medium
meth.	Methyl
meth. al.	Methyl alcohol
m.e.p.	Mean effective pressure
met.	Metallic
mg	Milligram
m.h.c.p.	Mean horizontal candle power
mi.	Mile
mic.	Microscopic
micro-	Prefix meaning 1/1,000,000 or 10^{-6}
micro-micro	Prefix meaning 10^{-12}
milli-	Prefix meaning 1/1,000
milli-micro-	Prefix meaning 10^{-9}
min *or* min.	Minute
min.	Minim; minimum; mineral
ml	Milliliter
m.l.h. c.p.	Mean lower hemispherical candle power
mm	Millimeter
mm^2	Square millimeter
mm^3	Cubic millimeter
mmf *or* m.m.f.	Magnetomotive force
mol.	Molecule
Mol. Wt.	Molecular weight
monocl.	Monoclinic
m.p.	Melting point
m.s.c.p.	Mean spherical candle power
myria-	Prefix meaning 10,000 or 10^4
mμ	Millimicron; millimicro-
N	Numeric; number (in mathematical tables)
n.	Normal
n	Refractive index
need.	Needles
o	Ortho-
Obs.	Observer
octahdr.	Octahedral
oil turp.	Oil of turpentine
or.	Orange
oz.	Ounce
oz. ap. *or* ℥ ap.	Ounce, apothecaries'
oz. av. *or* ℥ av.	Ounce, avoirdupois
oz. fl. *or* ℥ fl.	Ounce, fluid
oz. t. *or* ℥ t.	Ounce, troy
p	Para-
pa.	Pale
p. ct.	Per cent
perp.	Perpendicular
p.f.	Power factor
pk.	Peck
pl.	Plates
powd.	Powder
pr.	Prisms
precip. *or* p'p't'd	Precipitated
p. sol.	Partly soluble
pt.	Point; pint
purp.	Purple
pyr.	Pyridine
Q	Quantity
q	Quintal
qt.	Quart
q.v.	*Quod vide*, which see
R	Réaumur; radioactive mineral
rac	Racemic
rad	Radian, measure of angle
rad.	Radius
rd.	Rod
reg.	Regular
rev.	Revolution
rhbdr.	Rhombohedral
rhomb.	Rhombic or orthorhombic
R.M.S.	Square root of mean square
r.p.m.	Revolutions per minute
s	Stere
s.	Scruple; soluble; second
s. ap. *or* ℈	Scruple, apothecaries'
sat. *or* sat'd	Saturated
sc.	Scales
S.E.	Siemens unit
sec *or* sec.	Second (mean solar unless contrary is stated)
sec	Secant
sec^{-1}	Arc or angle whose secant is . . .
sech	Hyperbolic secant
sech^{-1}	Inverse hyperbolic secant
segm.	Segment
sh.	Short
sin	Sine
sin^{-1}	Arc or angle whose sine is . . .
sinh	Hyperbolic sine
sinh^{-1}	Inverse hyperbolic sine
sl.	Slightly
sm.	Small
sol.	Solution; soluble
soln.	Solution
sp.	Specific
specif.	Specification
sp. gr.	Specific gravity
sq.	Square
sq. ch.	Square chain
sq. ft.	Square foot
sq. in.	Square inch
sq. mi.	Square mile
sq. rd.	Square rod
sq. yd.	Square yard
std.	Standard
subl.	Sublimes
sym.	Symmetrical
t	Metric ton
t.	Troy
tab. *or* tabl.	Tablets
tan	Tangent
tan^{-1}	Arc or angle whose tangent is . . .
tanh	Hyperbolic tangent
tanh^{-1}	Inverse hyperbolic tangent
temp.	Temperature
tetr. *or* tetrag.	Tetragonal
tn.	Ton
tr.	Transition
tricl.	Triclinic
trig.	Trigonal
trim.	Trimetric
T.S.	Tensile strength
turp.	Turpentine
Tw.°	Degrees Twaddell, hydrometer scale
ult.	Ultimate
uns.	Unsymmetrical
U.S.	United States of America; universal system of lens apertures
v.	Very
v.	*Vide*, see
vel. *or* veloc.	Velocity
vers	Versed sine
vert	Vertical
visc.	Viscous
vol.	Volume
volt.	Volatilizes
w.	Water
wh.	White
wt.	Weight
yd.	Yard
yel.	Yellow
yr.	Year
μ	Micron; micro-
$\mu\mu$	Micromicron; micromicro-

SPELLING AND SYMBOLS FOR UNITS

From "Units of Weight and Measure"
L. B. Chisholm, National Bureau of Standards
Miscellaneous Publication 286 (May, 1967)

The spelling of the names of units as adopted by the National Bureau of Standards is that given in the list below. The spelling of the metric units is in accordance with that given in the law of July 28, 1866, legalizing the Metric System in the United States.

Following the name of each unit in the list below is given the symbol that the Bureau has adopted. Attention is particularly called to the following principles:

1. No period is used with symbols for units. Whenever "in" for inch might be confused with the preposition "in", "inch" should be spelled out.

2. The exponents "^{2}" and "^{3}" are used to signify "square" and "cubic," respectively, instead of the symbols "sq" or "cu," which are, however, frequently used in technical literature for the U. S. Customary units.

3. The same symbol is used for both singular and plural.

Some Units and Their Symbols

Unit	Symbol
acre	acre
are	a
barrel	bbl
board foot	fbm
bushel	bu
carat	c
Celsius, degree	°C
centare	ca
centigram	cg
centiliter	cl
centimeter	cm
chain	ch
cubic centimeter	cm^3
cubic decimeter	dm^3
cubic dekameter	dam^3
cubic foot	ft^3
cubic hectometer	hm^3
cubic inch	in^3
cubic kilometer	km^3
cubic meter	m^3
cubic mile	mi^3
cubic millimeter	mm^3
cubic yard	yd^3
decigram	dg
deciliter	dl
decimeter	dm
dekagram	dag
dekaliter	dal
dekameter	dam
dram, avoirdupois	dr avdp
fathom	fath
foot	ft
furlong	furlong
gallon	gal
grain	grain
gram	g
hectare	ha
hectogram	hg
hectoliter	hl
hectometer	hm
hogshead	hhd
hundredweight	cwt
inch	in
International Nautical Mile	INM
Kelvin, degree	°K
kilogram	kg
kiloliter	kl
kilometer	km
link	link
liquid	liq

SYMBOLS, UNITS AND NOMENCLATURE IN PHYSICS

From Document U.I.P. 11 (S.U.N. 65–3)
International Union of Pure and Applied Physics
Used by permission of the Secretary

1. PHYSICAL QUANTITIES—GENERAL RECOMMENDATIONS.

1.1 The symbol for a ***physical quantity*** (french: 'grandeur physique', german: 'physikalische Grösse', american sometimes: 'physical magnitude') is equivalent to the product of the *numerical value* (or the measure), a pure number, and a *unit*, i.e.

$$\text{physical quantity} = \text{numerical value} \times \text{unit}.$$

For dimensionless physical quantities the unit often has no name or symbol and is not explicitly indicated.

Examples: $E = 200\ \text{erg}$ $\quad F = 27\ \text{N}$ $\quad n = 1.55$ (for quartz) $\quad \nu = 3 \times 10^{8}\ \text{s}^{-1}$

1.2 Symbols for physical quantities—General rules.

1. *Symbols for physical quantities* should be *single letters* of the latin or greek alphabet with or without modifying signs: subscripts, superscripts, dashes, etc.

Remark:

a. An exception to this rule consists of the two letter symbols, which are sometimes used to represent dimensionless combinations of physical quantities. If such a symbol, composed of two letters, appears as a factor in a product, it is recommended to separate this symbol from the other symbols by a dot or by brackets or by a space.

b. Abbreviations, i.e. shortened forms of names or expressions, such as p.f. for partition function, should not be used in physical equations. These abbreviations in the text should be written in ordinary roman type.

2. *Symbols for physical quantities* should be printed in *italic* (or *sloping*) *type.*

Remark:

It is recommended to consider as a guiding principle for the printing of indices the criterion: only indices which are symbols for physical quantities should be printed in italic (sloping) type. *Examples:*

Upright indices:	*Sloping indices:*
C_{g} (g = gas)	p in C_p
g_{n} (n = normal)	n in $\Sigma_n a_n \varphi_n$
μ_{r} (r = relative)	x in $\Sigma_x a_x b_x$
E_{k} (k = kinetic)	i, k in g_{ik}
χ_{e} (e = electric)	x in p_x

3. *Symbols for vectors and tensors:* To avoid the usage of subscripts it is often convenient to indicate vectors and tensors of the second rank by letters of a special type. The following choice is recommended:

a. Vectors should be printed in bold type, by preference bold italic (sloping) type, e.g. $\boldsymbol{A}$, $\boldsymbol{a}$.

b. Tensors of the second rank should be printed in bold face sans serif type, e.g. $\mathsf{\mathbf{S}}$, $\mathsf{\mathbf{T}}$.

Remark:

When this is not available, vectors may be indicated by an arrow and tensors by a double arrow on top of the symbol.

1.3 Simple mathematical operations.

1. *Addition and subtraction* of two physical quantities are indicated by:

$$a + b \qquad \text{and} \qquad a - b$$

2. *Multiplication* of two physical quantities may be indicated in one of the following ways:

$$ab \qquad a\ b \qquad a\,.\,b \qquad a \cdot b \qquad a \times b$$

Remark: The various products of vectors and tensors may be written in the following ways:

scalar product of vectors $\boldsymbol{A}$ and $\boldsymbol{B}$:	$\boldsymbol{A}\,.\,\boldsymbol{B}$	$\boldsymbol{A} \cdot \boldsymbol{B}$
vector product of vectors $\boldsymbol{A}$ and $\boldsymbol{B}$:	$\boldsymbol{A} \wedge \boldsymbol{B}$	$\boldsymbol{A} \times \boldsymbol{B}$
dyadic product of vectors $\boldsymbol{A}$ and $\boldsymbol{B}$:	$\boldsymbol{AB}$	
scalar product of tensors $\mathsf{\mathbf{S}}$ and $\mathsf{\mathbf{T}}$ ($\Sigma_{i,k} S_{ik} T_{ki}$)	$\mathsf{\mathbf{S}} : \mathsf{\mathbf{T}}$	
tensor product of tensors $\mathsf{\mathbf{S}}$ and $\mathsf{\mathbf{T}}$ ($\Sigma_k S_{ik} T_{kl}$)	$\mathsf{\mathbf{S}} \cdot \mathsf{\mathbf{T}}$	$\mathsf{\mathbf{S}}\,.\,\mathsf{\mathbf{T}}$
product of tensor $\mathsf{\mathbf{S}}$ and vector $\boldsymbol{A}$ ($\Sigma_k S_{ik} A_k$)	$\mathsf{\mathbf{S}} \cdot \boldsymbol{A}$	$\mathsf{\mathbf{S}}\,.\,\boldsymbol{A}$

3. *Division* of one quantity by another quantity may be indicated in one of the following ways:

$$\frac{a}{b} \qquad a/b \qquad a\ b^{-1}$$

or in any other way of writing the product of a and b^{-1}.

These procedures can be extended to cases where one of the quantities or both are themselves products, quotients, sums or differences of other quantities.

If necessary brackets have to be used in accordance with the rules of mathematics. If the solidus is used to separate the numerator from the denominator and if there is any doubt where the numerator starts or where the denominator ends, brackets should be used.

Examples:

Expressions with a horizontal bar:	*Same expressions with a solidus:*
$\frac{a}{bcd}$	a/bcd
$\frac{2}{9}\sin kx,\ \frac{1}{2}RT$	$(2/9)\sin kx,\ (1/2)RT$ or $RT/2$
$\frac{a}{b} - c$	$a/b - c$
$\frac{a}{b - c}$	$a/(b - c)$
$\frac{a - b}{c - d}$	$(a - b)/(c - d)$
$\frac{a}{c} - \frac{b}{d}$	$a/c - b/d$

Remark: It is recommended that in expressions like:

$$\sin\{2\pi(x - x_0)/\lambda\} \qquad \exp\{(r - r_0)/\sigma\}$$
$$\exp\{-V(r)/kT\} \qquad \surd(\epsilon/c^2)$$

the argument should always be placed between brackets, except when the argument is a simple product of two quantities: e.g. sin kx. When the horizontal bar above the square root is used no brackets are needed.

2. UNITS—GENERAL RECOMMENDATIONS.

2.1 Symbols for units—General rules.

1. *Symbols for units* of physical quantities should be printed in *roman* (*upright*) *type.*
2. *Symbols for units* should not contain a final full stop and should remain unaltered in the plural, e.g.: 7 cm and *not* 7 cms.
3. *Symbols for units* should be printed in *lower case* roman (upright) type. However, the symbol for a unit, derived from a proper name, should start with a capital roman letter, e.g.: m (metre); A (ampere); Wb (weber); Hz (hertz).

2.2 Prefixes—General rules.

1. The following *prefixes* should be used to indicate decimal fractions or multiples of a unit

deci; *déci*	$(= 10^{-1})$	d			
centi; *centi*	$(= 10^{-2})$	c			
milli; *milli*	$(= 10^{-3})$	m	kilo; *kilo*	$(= 10^{3})$	k
micro; *micro*	$(= 10^{-6})$	μ	mega; *méga*	$(= 10^{6})$	M
nano; *nano*	$(= 10^{-9})$	n	giga; *giga*	$(= 10^{9})$	G
pico; *pico*	$(= 10^{-12})$	p	tera; *téra*	$(= 10^{12})$	T
femto; *femto*	$(= 10^{-15})$	f			
atto; *atto*	$(= 10^{-18})$	a			

2. The use of *double prefixes* should be avoided when single prefixes are available.

Not: mμs,	*but:* ns	(nanosecond)
Not: kMW	*but:* GW	(gigawatt)
Not: μμF,	*but:* pF	(picofarad)

3. When a prefix is placed before the symbol of a unit, the *combination of prefix and symbol* should be considered as *one new symbol,* which can be raised to a positive or negative power without using brackets.

Examples:

$$\mathrm{cm}^3 \quad , \quad \mathrm{mA}^2 \quad , \quad \mu\mathrm{s}^{-1}$$

Remark:

cm^3 *means always* $(0.01\ \mathrm{m})^3$ *but never* $0.01\ \mathrm{m}^3$

$\mu\mathrm{s}^{-1}$ *means always* $(10^{-6}\mathrm{s})^{-1}$ *but never* $10^{-6}\ \mathrm{s}^{-1}$

2.3 Mathematical operations.

1. *Multiplication* of two units may be indicated in one of the following ways:

$$\mathrm{Nm} \qquad \mathrm{N\ m} \qquad \mathrm{N\cdot m} \qquad \mathrm{N\,.\,m}$$

2. *Division* of one unit by another unit may be indicated in one of the following ways:

$$\frac{\mathrm{m}}{\mathrm{s}} \qquad \mathrm{m/s} \qquad \mathrm{m\ s^{-1}}$$

or by any other way of writing the product of m and s^{-1}.
Not more than one solidus should be used. *Examples:*

Not: cm/s/s,	*but:* $\mathrm{cm/s^2} = \mathrm{cm\ s^{-2}}$
Not: 1 poise = 1 g/s/cm,	*but:* 1 poise = 1 g/s cm = $1\ \mathrm{gm\ sec^{-1}\ cm^{-1}}$
Not: J/°K/mol,	*but:* J/°K mol = $\mathrm{J°K^{-1}\ mol^{-1}}$

3. NUMBERS.

1. *Numbers* should be printed in *upright type.*
2. The *decimal sign* between digits in a number should be a comma (,) or (but *only* in *English* texts) a point (.).
3. The *multiplication* sign between numbers should be a cross (×) or (but *only in non-English* texts) a centered dot, e.g. 2.3×3.4 or $2{,}3 \cdot 3{,}4$.
4. *Division* of one number by another number may be indicated in the following ways:

$$\frac{136}{273.15} \qquad 136/273.15$$

or by writing it as the product of numerator and the inverse first power of the denominator. In such cases the number under the inverse power should always be placed between brackets.

Remark: When the solidus is used and when there is any doubt where the numerator starts or the denominator ends, brackets should be used, as in the case of quantities (see 1.3.3).

5. To facilitate the reading of *long numbers,* the digits may be grouped in *groups of three,* but *no* comma or point should be used except for the decimal sign.
Example: 2 573. 421 736.

4. SYMBOLS FOR CHEMICAL ELEMENTS, NUCLIDES AND PARTICLES.

1. *Symbols for chemical elements* should be written in *roman* (upright) *type.* The symbol is not followed by full stop.
Examples: Ca C H He
2. The attached numerals specifying a *nuclide* are:

$$\text{mass number } {}^{14}\mathrm{N}_{2\ \text{atoms/molecule}}$$

Remark: The atomic number may be placed as a left subscript, if desired. The right superscript position should be used, if required, for indicating a state of ionisation (e.g. $\mathrm{Ca^{2+}}$, $\mathrm{PO_4^{3-}}$) or an excited state (e.g. $^{110}\mathrm{Ag^m}$, $\mathrm{He^*}$).

3. *Symbols for particles and quanta.*
It is recommended that the following notation be used:

proton:	p	pion	π
neutron:	n	K-meson	K
Λ-particle	Λ	electron	e
Σ-particle	Σ	muon	μ
Ξ-particle	Ξ	neutrino	ν
deuteron	d		
triton	t	photon	γ
α-particle	α		

A nucleon (proton or neutron) is indicated by N
It is recommended that the charge of particles may be indicated by adding the superscript +, − or 0.
Examples:

$$\pi^+\ \pi^-\ \pi^0,\ \mathrm{p^+\ p^-},\ \mathrm{e^+\ e^-}.$$

If in connection with the symbols p and e no charge is indicated, these symbols should refer to the positive proton and the negative electron respectively.
The tilde ~ above the symbol of a particle is used to indicate the corresponding anti-particle.

Examples:

$$\tilde{\mathrm{n}},\ \nu,\ \sim\tilde{\mathrm{p}},\ \tilde{\mathrm{N}}$$

5. QUANTUM STATES.

5.1 *General rules.*

A letter-symbol indicating the quantum state of a *system* should be printed in capital upright type.
A letter-symbol indicating the quantum state of a *single particle* should be printed in lower case upright type.

5.2 *Atomic spectroscopy.*

The letter-symbols indicating atomic quantum states are:

$L, l = 0$: S, s
$= 1$: P, p
$= 2$: D, d
$= 3$: F, f

$L, l = 4$: G, g
$= 5$: H, h
$= 6$: I, i
$= 7$: K, k

$L, l = 8$: L, l
$= 9$: M, m
$= 10$: N, n
$= 11$: O, o

A right hand subscript indicates the total angular momentum quantum number J or j.
A left hand superscript indicates the spin multiplicity $2S + 1$.

Example: ${}^2\mathrm{P}_{3/2}$—state ($J = 3/2$, multiplicity 2)
$\mathrm{p}_{3/2}$—electron ($j = 3/2$)

An atomic electron configuration is indicated symbolically by:

$$(nl)^{\kappa} \quad (n'l')^{\kappa'} \ . \ . \ .$$

Instead of $l = 0, 1, 2, 3$ . . . one uses the quantum state symbol s, p, d, f, . . .

Example: the atomic configuration: $(1\mathrm{s})^2\,(2\mathrm{s})^2\,(2\mathrm{p})^3$.

5.3 *Molecular spectroscopy.*

The letter symbols, indicating molecular electronic quantum states are in the case of *linear molecules:*

$$\begin{aligned} \Lambda, \lambda &= 0:\ \Sigma, \sigma \\ &= 1:\ \Pi, \pi \\ &= 2:\ \Delta, \delta \end{aligned}$$

and for *non-linear molecules*

A, a ; B, b ; E, e ; etc.

Remarks: A left hand superscript indicates the spin multiplicity. For molecules having a symmetry center the parity symbol g or u, indicating respectively symmetric or antisymmetric behaviour on inversion, is attached as a right hand subscript. A + or − sign attached as a right hand superscript indicates the symmetry as regards reflection in any plane through the symmetry axis of the molecules.

Examples: Σ_g^+, Π_u, ${}^2\Sigma$, ${}^3\Pi$, etc.

The letter symbols indicating the vibrational angular momentum states in the case of *linear molecules* are

$$\begin{aligned} l &= 0:\ \Sigma \\ &= 1:\ \Pi \\ &= 2:\ \Delta \end{aligned}$$

5.4 *Nuclear spectroscopy.*

The spin and parity assignment of a nuclear state is

$$J^{\pi}$$

where the parity symbol π is + for even and − for odd parity.

Examples: 3^+, 2^-, etc.

A shell model configuration is indicated symbolically by:

$$(nlj)^{\kappa} \quad (n'l'j')^{\kappa'}$$

where the first bracket refers to the proton shell and the second to the neutron shell. Negative values of κ or κ' indicate holes in a completed shell. Instead of $l = 0, 1, 2, 3$, . . . one uses the quantum state symbols s, p, d, f, . . .

Example: the nuclear configuration: $(1\ \mathrm{d}\ 3/2)^3\,(1\ \mathrm{f}\ 7/2)^2$

5.5 *Spectroscopic transitions.*

1. The upper level and the lower level are indicated by ′ and ″ respectively.

Examples: $h\nu = E' - E''$ $\sigma = T' - T''$

2. A spectroscopic transition should be indicated by writing the upper state first and the lower state second, connected by a dash inbetween.

Examples:		
	$^2P_{1/2} - {}^2S_{1/2}$	for an electronic transition
	$(J', K') - (J'', K'')$	for a rotational transition
	$v' - v''$	for a vibrational transition.

3. Absorption transition and emission transition may be indicated by arrows ← and → respectively.

Examples:

$^2P_{1/2} \rightarrow {}^2S_{1/2}$ emission from $^2P_{1/2}$ to $^2S_{1/2}$

$(J', K') \leftarrow (J'', K'')$ absorption from (J'', K'') to (J', K')

4. The difference Δ between two quantum numbers should be that of the upper state minus that of the lower state.

Example: $\Delta J = J' - J''$

5. The indications of the branches of the rotation band should be as follows:

$\Delta J = J' - J'' = -2$: O – branch
$= -1$: P – branch
$= 0$: Q – branch
$= +1$: R – branch
$= +2$: S – branch

6. NOMENCLATURE.

1. *Use of the word specific.*

The word 'specific' in English names for physical quantities should be restricted to the meaning 'divided by mass'. *Examples:*

specific volume	volume/mass
specific energy	energy/mass
specific heat capacity	heat capacity/mass

2. *Notation for covariant character of coupling.*

S Scalar coupling
V Vector coupling
T Tensor coupling
A Axial vector coupling
P Psuedoscalar coupling

3. *Abbreviated notation for a nuclear reaction.*

The meaning of the symbolic expression indicating a nuclear reaction should be the following:

initial nuclide (incoming particle(s) or quanta, outgoing particle(s) or quanta) final nuclide

Examples: $^{14}N(\alpha,p)^{17}O$ $\quad$ $^{59}Co(n,\gamma)^{60}Co$
$^{23}Na(\gamma,3n)^{20}Na$ $\quad$ $^{31}P(\gamma,pn)^{29}Si$

4. *Character of transitions.*

Multipolarity of transition:

electric or magnetic	monopole	E0	or	M0
" " "	dipole	E1	or	M1
" " "	quadrupole	E2	or	M2
" " "	octupole	E3	or	M3
" " "	2^n-pole	E*n*	or	M*n*

parity change in transition:

transition *with* parity change:	yes
transition *without* parity change:	no

5. *Nuclide:* A species of *atoms,* identical as regards atomic number (proton number) and mass number (nucleon number) should be indicated by the word *nuclide,* not by the word isotope.
Different nuclides having the same atomic number should be indicated as *isotopes* or *isotopic nuclides.*
Different nuclides having the same mass number should be indicated as *isobars* or *isobaric nuclides.*

6. *Sign of polarization vector (Basel Convention).*

In nuclear interactions the positive polarization of particles with spin ½ is taken in the direction of the vector product

$$\boldsymbol{k}_i \times \boldsymbol{k}_0,$$

where $\boldsymbol{k}_i$ and $\boldsymbol{k}_0$ are the circular wave vectors of the incoming and outgoing particles respectively.

7. RECOMMENDED SYMBOLS FOR PHYSICAL QUANTITIES.

Remark:

(1) Where several symbols are given for one quantity, and no special indication is made, they are on equal footing.
(2) In general, no special attention is paid to the name of the quantity.

7.1 Space and time.

space coordinates; *coordonnées d'espace*	(x, y, z)	
position vector; *vecteur de position*	$\boldsymbol{r}$	
length; *longueur*	l	
breadth; *largeur*	b	
height; *hauteur*	h	
radius; *rayon*	r	
thickness; *épaisseur*	d, δ	
diameter; *diamètre:* $d = 2r$	d	
path; *parcours:* $L = \int \mathrm{d}s$	L, s	
area; *aire; superficie*	A, S	
volume; *volume*	$V, (v)$	
plane angle, *angle plan*	$\alpha, \beta, \gamma, \theta, \vartheta, \varphi$	
solid angle; *angle solide*	ω, Ω	
wave length; *longueur d'onde*	λ	
wave number; *nombre d'onde* $\sigma = 1/\lambda$	σ	*)
wave vector; *vecteur d'onde*	σ	
circular wave number; *nombre d'onde circulaire:* $k = 2\pi/\lambda$	k	
circular wave vector; *vecteur d'onde circulaire*	$\boldsymbol{k}$	
attenuation coefficient; *constante d'affaiblissement:* $F(x) = \exp(-\alpha x) \cos \beta x$	α	
phase coefficient; *constante de phase*	β	
propagation coefficient; *constante de propagation:* $\gamma = \alpha + \mathrm{i}\beta$	γ	
time; *temps*	$\boldsymbol{t}$	
period; *période*	T	
frequency; *fréquence:* $\nu = 1/T$	ν, f	
pulsatance; *pulsation:* $\omega = 2\pi\nu$	ω	**)
relaxation time; *temps de relaxation:* $F(t) = \exp(-t/\tau)$	τ	
damping coefficient; *coefficient d'amortissement:* $F(t) = \exp(-\delta t) \sin \omega t$	δ	
logarithmic decrement; *décrément logarithmique:* $\Lambda = T\delta = T/\tau$	Λ	
velocity; *vitesse:* $v = \mathrm{d}s/\mathrm{d}t$	u, v	
angular velocity; *vitesse angulaire:* $\omega = \mathrm{d}\varphi/\mathrm{d}t$	ω	
acceleration; *accélération:* $a = \mathrm{d}v/\mathrm{d}t$	a	
angular acceleration; *accélération angulaire:* $\alpha = \mathrm{d}\omega/\mathrm{d}t$	α	
acceleration of free fall; *accélération de la pesanteur*	g	
standard — —; *— — normale*	g_n	
speed of light in empty space; *vitesse de la lumière dans le vide*	c	
v/c	β	
relativistic coordinates; *coordonnées relativistes:*	$(x_0 x_1 x_2 x_3)$	
$x_0 = ct, x_1 = x, x_2 = y, x_3 = z, x_4 = \mathrm{i}ct$	$(x_1 x_2 x_3 x_4)$	

7.2 Mechanics.

mass; *masse*	m
(mass) density; *masse volumique:* $\rho = m/V$	ρ
relative density; *densité relative:* $d = \rho/\rho(\mathrm{H_2O})$	d
specific volume; *volume massique:* $v = V/m = 1/\rho$	v
reduced mass; *masse réduite:* $\mu = m_1 m_2/(m_1 + m_2)$	μ
momentum; *quantité de mouvement:* $\boldsymbol{p} = m\boldsymbol{v}$	$\boldsymbol{p}$
angular momentum; *moment cinetique:* $\boldsymbol{L} = \boldsymbol{r} \times \boldsymbol{p}$	$\boldsymbol{L}$
second moment of plane area; *moment quadratique d'une aire plane:* $I_{\mathrm{a},y} = \int x^2 \mathrm{d}x\mathrm{d}y$	I_a
second polar moment of plane area; *moment quadratique polaire d'une aire plane:* $I_\mathrm{p} = \int (x^2 + y^2)\, \mathrm{d}x\mathrm{d}y$	I_p
moment of inertia; *moment d'inertie:* $I_z = \int (x^2 + y^2)\, \mathrm{d}m$	I, J
force; *force*	$\boldsymbol{F}$
torque, moment of a couple; *torque, moment d'un couple*	$\boldsymbol{T}$
weight; *poids*	$G, (W, P)$
moment of force; *moment d'une force*	$\boldsymbol{M}$
pressure; *pression*	p
normal stress; *tension normale*	σ
shear stress; *tension de cisaillement*	τ
gravitational constant; *constante de gravitation:* $F(r) = G\, m_1 m_2/r^2$	G
linear strain, relative elongation; *dilation linéaire relative:* $\epsilon = \Delta l/l_0$	ϵ
modulus of elasticity, Young's modulus; *module d'élasticité:* $\sigma = E\, \epsilon$	E
shear strain; shear angle; *glissement unitaire*	γ
shear modulus; *module de torsion:* $\tau = G \operatorname{tg} \gamma$	G
volume strain, bulk strain; *dilation volumique relative:* $\theta = \Delta V/V_0$	θ
bulk modulus; *module de compression:* $p = -K\theta$	K
Poisson ratio, *rapport de Poisson*	μ, ν
viscosity; *viscosité*	$\eta, (\mu)$
kinematic viscosity; *viscosité cinématique:* $\nu = \eta/\rho$	ν
friction coefficient; *coefficient de frottement*	$\mu, (f)$
surface tension; *tension superficielle*	γ, σ
energy; *énergie*	E, W
potential energy; *énergie potentielle*	E_p, V, Φ
kinetic energy; *énergie cinétique*	E_k, T, K
work; *travail*	W, A

---

permeability; *perméabilité:* $\mathbf{B} = \mu \mathbf{H}$	μ
permeability of vacuum; *perméabilité du vide*	μ_0
relative permeability; *perméabilité relative:* $\mu_r = \mu/\mu_0$	μ_r
magnetization; *aimantation:* $\mathbf{B} = \mu_0(\mathbf{H} + \mathbf{M})$	$\mathbf{M}$
magnetic susceptibility; *susceptibilité magnétique*	χ_m
electromagnetic moment; *moment électromagnétique:* $E_p = -\boldsymbol{m}. \boldsymbol{B}$	μ, $\boldsymbol{m}$
magnetic polarization; *polarisation magnétique:* $\boldsymbol{B} = \mu_0 \mathbf{H} + \boldsymbol{J}$	$\boldsymbol{J}$
resistance; *résistance*	R
reactance; *réactance*	X
quality factor: *facteur de qualité:* $Q = \lvert X \rvert / R$	Q
impedance; *impédance:* $Z = R + \mathrm{i}\, X$	Z
admittance; *admittance:* $Y = 1/Z = G + \mathrm{i}B$	Y
conductance; *conductance*	G
susceptance; *susceptance*	B
resistivity; *résistivité*	ρ
conductivity; *conductivité* $\gamma = 1/\rho$	γ, σ
self inductance; *inductance propre*	L
mutual inductance; *inductance mutuelle*	M, L_{12}
coupling coefficient; *coefficient de couplage:* $k = L_{12}/(L_1 L_2)^{1/2}$	k
phase number; *nombre de phases*	m
loss angle; *angle de pertes*	δ
number of turns; *nombre de tours*	N
power: *puissance*	P
electromagnetic energy density; *énergie électromagnetique volumique*	w
Poynting vector; *vecteur de Poynting*	$\boldsymbol{S}$
magnetic vector potential; *potentiel vecteur magnétique*	$\boldsymbol{A}$

7.6 Radiation, light.[†]

radiant energy; *énergie rayonnante*	Q, (Q_e), W
radiant flux, radiant power; *flux énergétique, puissance rayonnante*	Φ, (Φ_e), P
radiant intensity; *intensité énergétique*	I, (I_e)
irradiance; *irradiance, éclairement énergétique*	E, (E_e)
radiance; *luminance énergétique, radiance*	L, (L_e)
radiant emittance; *émittance énergétique*	M, (M_e)
quantity of light; *quantité de lumière*	Q, (Q_V)
luminous flux; *flux lumineux*	Φ, (Φ_V)
luminous intensity; *intensité lumineuse:* $d\Phi/d\omega$	I, (I_V)
illuminance, illumination; *éclairement lumineux:* $d\Phi/dS$	E, (E_V)
luminance; *luminance:* $dI/dS \cos \vartheta$	L, (L_V)
luminous emittance; *émittance lumineuse:* $d\Phi/dS$	M, (M_V)
absorption factor; *facteur d'absorption:* Φ_a/Φ_0	α
reflection factor; *facteur de réflexion* Φ_r/Φ_0	ρ
transmission factor; *facteur de transmission* Φ_{tr}/Φ_0	τ
(linear) absorption coefficient; *coefficient d'absorption (linéique)*	a
(linear) extinction coefficient; *coefficient d'atténuation (linéique)*	μ
speed of light in empty space; *vitesse de la lumière dans le vide*	c
refractive index; *indice de réfraction:* $n = c/c_n$	n

[††] Written in rationalized, 4-dimensional form. See Appendix, section 2.

[†] The symbols between brackets are reserve symbols and are to be used whenever it is necessary to distinguish between radiation and light quantities.

7.7 Acoustics.

velocity of sound; *vitesse du son*	c
velocity of longitudinal waves; *vitesse d'ondes longitudinale*	c_l
velocity of transversal waves; *vitesse d'ondes transversale*	c_t
group velocity; *vitesse de groupe*	c_g
sound energy flux; *flux énergétique du son*	P
reflexion factor; *facteur de réflexion:* P_r/P_0	ρ
acoustic absorption factor; *facteur d'absorption acoustique* $1 - \rho$	α_a (α)
transmission factor; *facteur de transmission:* P_{tr}/P_c	τ
dissipation factor; *facteur de dissipation:* $\alpha_a - \tau$	δ
loudness level; *niveau d'isosonie*	L_N, (Λ)

7.8 Quantum mechanics.

complexe conjugate of Ψ; *complexe conjugué de* Ψ	Ψ^*
probability density; *densité de probabilité:* $P = \Psi^*\Psi$	P
probability current density: *densité de courant de probabilité:* $\boldsymbol{S} = (\hbar/2im)(\Psi^*\Delta\Psi - \Psi\Delta\Psi^*)$	$\boldsymbol{S}$
charge density of electrons; *charge volumique d'électrons:* $\rho = -eP$	ρ
electric current density of electrons; *densité de courant électrique d'électrons:* $\boldsymbol{j} = -e\boldsymbol{S}$	$\boldsymbol{j}$
expectation value of A; *valeur moyenne de* A	$\langle A \rangle$, $\bar{A}$
commutator of A and B, *commutateur de* A *et* B: $[A,B] = AB - BA$	$[A,B]$, $[A,B]$
anticommutator of A and B; *anticommutateur de* A *et* B: $[A,B]_+ = AB + BA$	$[A,B]_+$
matrix element; *élément de matrice:* $A_{ij} = \int \psi_i^*(A\psi_j)\,\mathrm{d}\tau$	A_{ij}
Hermitian conjugate of operator A; *conjugué Hermitien de l'opérateur* A	$A^\dagger$
momentum operator in coordinate representation; *opérateur de quantité de mouvement*	$+(\hbar/\mathrm{i})\Delta$
annihilation operators; *opérateurs d'annihilation*	a, b, α, β
creation operators; *opérateurs de création*	a^+, $b^\dagger$, $\alpha^\dagger$ $\beta^\dagger$

7.9 Atomic and nuclear physics.

mass number, nucleon number; *nombre de masse, nombre de nucléons*	A	
atomic number, proton number; *nombre atomique, nombre de protons*	Z	
neutron number; *nombre de neutrons:* $N = A - Z$	N	
elementary charge (of position); *charge élémentaire* (*du position*)	e	
electron mass; *masse de l'électron*	m, m_ϵ	
proton mass; *masse du proton*	m_p	
neutron mass; *masse du neutron*	m_n	
meson mass; *masse du méson*	m_π,	
nuclear mass; *masse nucléaire* (of nucleus: ^{A}X)	m_N, m_N (^{A}X)	
atomic; mass; *masse atomique* (of nuclide: ^{A}X)	m_a, m_a (^{A}X)	
(unified) atomic mass constant; *constante* (unifiée) *de masse atomique:* $m_u = m_a(^{12}\mathrm{C})/12$	m_u	
relative atomic mass; *masse atomique relative:* m_a/m_u	A_r	
Planck constant; *constante de Planck* ($\hbar = h/2\pi$)	h	
principal quantum number; *nombre quantique principal*	n, n_i	
orbital angular momentum quantum number; *nombre quantique de moment angulaire orbital*	L, l_i	
spin quantum number; *nombre quantique de spin*	S, s_i	
angular momentum quantum number; *nombre quantique de moment angulaire* (including electron spin)	J, j_i	
magnetic quantum number; — — *magnétique*	M, m_i	
nuclear spin quantum number; — — *de spin nucléaire*	I, J	*)
hyperfine quantum number; — — *hyperfin*	F	
rotational quantum number; — — *de rotation*	J, K	
vibrational quantum number; — — *de vibration*	v	
quadrupole moment; *moment quadripolaire*	Q	
Rydberg constant; *constante de Rydberg***)	R_∞	
Bohr radius; *rayon de Bohr***)	a_0	
fine structure constant; *constante de structure fine***)	α	
mass excess; *excès de masse:* $m_a - Am_u$	Δ	
packing fraction; *packing fraction:* Δ/Am_u	f	
nuclear radius; *rayon nucléaire:* $R = r_0A^{1/3}$	R	
magnetic moment of particle: *moment magnétique d'une particule*	μ	
magnetic moment of proton; *moment magnétique du proton*	μ_p	
magnetic moment of neutron; *moment magnétique du neutron*	μ_n	
magnetic moment of electron; *moment magnétique électronique*	μ_e	
Bohr magneton; *magnéton de Bohr***)	μ_B	
nuclear magneton; *magnéton nucléaire*	μ_N	
g-factor; *facteur g:* e.g. $g = \mu/I\mu_N$	g	
gyromagnetic ratio; *rapport gyromagnétique***)	γ	
Larmor (angular) frequency; *fréquence* (*angulaire*) *de Larmor***)	ω_L	
level width; *largeur d'un niveau*	Γ	

*) I is used in atomic physics. J in nuclear physics.
**) See for definition: Appendix, section 2.

mean life; *vie moyenne*	τ
reaction energy; *énergie de réaction*	Q
cross section; *section efficace*	σ
macroscopic cross section; *section efficace macroscopique:* $\Sigma = n\sigma$	Σ
impact parameter; *paramètre de collision*	b
scattering angle; *angle de diffusion*	$\vartheta, \theta, \varphi$
internal conversion coefficient; *coefficient de conversion interne*	α
disintegration energy; *énergie de désintégration*	Q
half life; *demi-vie*	$T_{\frac{1}{2}}$
reduced half life; *demi-vie réduite*	$fT_{\frac{1}{2}}$
decay constant, disintegration constant; *constante de désintégration*	λ
activity; *activité*	A
Compton wavelength; *longueur d'onde de Compton:* $\lambda_C = h/mc$	λ_C
electron radius; *rayon de l'électron***)	r_e
linear attenuation coefficient; *coeff. d'atténuation linéaire*	μ, μ_1
atomic attenuation coefficient; *coeff. d'atténuation atomique*	μ_a
mass attenuation coefficient; *coeff. d' atténuation massique*	μ_m
linear stopping power; *pouvoir d' arrêt linéaire*	S, S_1
atomic stopping power; *pouvoir d' arrêt atomique*	S_a
linear range; *distance de pénétration linéaire*	R, R_1
recombination coefficient; *coefficient de recombinaison*	α

7.10 Solid state physics.

fundamental translations for lattice; *translations fondamentales d'un réseau*	$\boldsymbol{a}, \boldsymbol{b}, \boldsymbol{c}$ $\boldsymbol{a}_1, \boldsymbol{a}_2, \boldsymbol{a}_3$
Miller indices; *indices de Miller*	h, k, l h_1, h_2, h_3
plane in lattice; *plan d'un réseau**)	(h, k, l) (h_1, h_2, h_3)
direction in lattice; *direction dans un réseau**)	$[h, k, l]$ $[h_1, h_2, h_3]$
fundamental translations in reciprocal lattice; *translations fondamentales de reseau réciproque*	$\boldsymbol{a}^*, \boldsymbol{b}^*, \boldsymbol{c}^*$ $\boldsymbol{b}_1, \boldsymbol{b}_2, \boldsymbol{b}_3$
vector in crystal lattice; *vecteur dans un réseau*	$\boldsymbol{r}$
distance between successive lattice planes; *distance de plans successifs d'un réseau*	d
Bragg angle; *angle de Bragg*	θ, ϑ
order of reflexion; *ordre du réflexion*	n
short range order parameter; *paramètre d'ordre* (*proche voisin*)	σ
long range order parameter; *paramètre d'ordre* (*longue distance*)	s
Burgers vector; *vecteur de Burgers*	$\boldsymbol{b}$
circular wave vector; propagation vector (of phonons); *vecteur d'onde circulaire, vecteur de propagation* (*de phonons*)	$\boldsymbol{q}$
circular wave vector, propagation vector (of particles); *vecteur d'onde circulaire, vecteur de propagation* (*de particules*)	$\boldsymbol{k}$
effective mass of electron; *masse effective d'une électron*	m^*, m_{eff}
Fermi energy; *énergie de Fermi*	E_F, ϵ_F
Fermi circular wave vector; *vecteur d'onde circulaire de Fermi*	$\boldsymbol{k}_F$
work function; *fonction de travail*	Φ
differential thermoelectric power; *force thermoélectrique différentielle*	$S, (\Sigma)$
Peltier coefficient; *coefficient de Peltier*	Π
Thomson coefficient; *coefficient de Thomson*	μ
piezoelectric coefficient; *coefficient piézoélectrique:* (polarization/stress)	d_{mn}
characteristic (Weiss) temperature; *température caractéristique* (*de Weiss*)	Θ, Θ_w
Curie temperature; *température de Curie*	T_C
Neel temperature; *température de Néel*	T_N
Hall coefficient; *coefficient de Hall*	R_H

7.11 Molecular spectroscopy.

qu.n. of component of electronic orbital angular momentum vector along symmetry axis; *n.qu. de la composante du moment angulaire orbital électronique suivant l'axe de symétrie*	Λ, λ_i
qu.n. of component of electronic spin along symmetry axis; *n.qu. de la composante du spin électronique suivant l'axe de symétrie*	Σ, σ_i
qu.n. of total electronic angular momentum vector along symmetry axis; *n.qu. du moment angulaire total électronique suivant l'axe de symétrie*	Ω, ω_i
qu.n. of electronic spin; *n.qu. du spin électronique*	S
qu.n. of nuclear spin; *n.qu. du spin nucléaire*	I
qu.n. of vibrational mode; *n.qu. d'un mode de vibration*	v
degeneracy of vibrational mode; *degré de dégénérescance d'une mode de vibration*	d
qu.n. of vibrational angular momentum; *n.qu. de moment angulaire vibrationnel* (L.M.)	l
qu.n. of total angular momentum; *n.qu. de moment angulaire total* (excluding nuclear spin)	J
qu.n. of component of $\boldsymbol{J}$ in direction of external field; *n.qu. de la composante de* $\boldsymbol{J}$ *dans la direction du champ extérieur*	M, M_J

*) Instead of the ordinary brackets (   ) and square brackets [   ], curly brackets {   } and diamond brackets ⟨   ⟩ are also used respectively.

	S
qu.n. of component of $\boldsymbol{S}$ in direction of external field; *n.qu. de la composante de dans la direction du champ extérieur*	M_S
qu.n. of total angular momentum; *n.qu. du moment angulaire total* (including nuclear spin) $\boldsymbol{F} = \boldsymbol{J} + \boldsymbol{I}$	F
qu.n. of component of $\boldsymbol{F}$ in direction of external field; *n.qu. de la composante de* $\boldsymbol{F}$ *dans la direction du champ extérieur*	M_F
qu.n. of component of $\boldsymbol{I}$ in direction of external field; *n.qu. de la composante de* $\boldsymbol{I}$ *dans la direction du champ extérieur*	M_I
qu.n. of component of angular momentum along axis; *n.qu. de la composante du moment angulaire suivant l'axe* (L.M. and S.T.M.; excluding electron- and nuclear spin; for L.M.: ($K = \lvert\Lambda + l\rvert$)	K
qu.n. of total angular momentum; *n.qu. du moment angulaire total* (L.M. and S.T.M.; excluding electron and nuclear spin: $\boldsymbol{J} = \boldsymbol{N} + \boldsymbol{S}$*)	N
qu.n. of component of angular momentum along symmetry axis; *n.qu. de la composante du moment angulaire suivant l'axe de symétrie* (L.M. and S.T.M., excluding nuclear spin; for L.M.: $P = \lvert K + \Sigma\rvert$**)	P
electronic term; *terme électronique:* $T_e = E_e/hc$†)	T_e
vibrational term; *terme de vibration:* $G = E_{\text{vibr}}/hc$	G
coefficients in expression for vibrational term (for D.M.); *coefficients de l'expression d'un terme de vibration:* $$G = \sigma_e(v + \tfrac{1}{2}) - x\sigma_e(v + \tfrac{1}{2})^2$$	σ_e, $x\sigma_e$
coefficients in expression for vibrational term (for P.M.) *coefficients de l'expression d'un terme de vibration:* $$G = \Sigma\sigma_j(v_j + \tfrac{1}{2}d_j) + \tfrac{1}{2}\Sigma\Sigma x_{jk}(v_j + \tfrac{1}{2}d_j)(v_k + \tfrac{1}{2}d_k)$$	σ_i, x_{jk}
rotational term; *terme de rotation:* $F = E_{\text{rot}}/hc$	F
principal moments of inertia; *moments principaux d'inertie:* $I_A \leqslant I_B \leqslant I_C$††)	I_A, I_B, I_C
rotational constants; *constants de rotation:* $A = h/8\pi^2 cI_A$, etc.††)	A, B, C
total term; *terme total:* $T = T_e + G + F$	T

Remark: L.M. = linear molecules. *S.T.M.* = symmetric top molecules.
D.M. = diatomic molecules. P.M. = polyatomic molecules.
See for further details: Report on Notation for the Spectra of Polyatomic Molecules (Joint Commission for Spectroscopy of I.U.P.A.P. and I.A.U. 1954) J. Chem. Phys. *23* (1955) 1997.

7.12 *Chemical physics.*

amount of substance; *quantité de substance*	ν, n	*)
molar mass of substance B; *masse molaire de la substance* B	M_B	
molarity of subst. B; *molarité de la subst.* B	c_B	
mole fraction of subst. B; *fraction molaire de la subst.* B	x_B	
mass fraction of subst. B; *fraction massique de la subst.* B	w_B	
volume fraction of subst. B; *fraction volumique de la subst.* B	φ_B	
mole ratio of solution; *rapport molaire d'une solution*	r	
molality of solution; *molalité d'une solution*	m	
chemical potential of subst. B; *potentiel chimique de la subst.* B	μ_B	
absolute activity of subst. B (dimensionless); *activité absolue de la subst.* B (*sans dimension*) $\lambda_B = \exp(\mu_B/kT)$	λ_B	
relative activity; *activité relative*	a_B	
activity coefficients; *coefficients d'activité*	γ_B, f_B	
osmotic pressure; *pression osmotique*	Π	
osmotic coefficient; *coefficient osmotique*	g, φ	
stoichiometric number of molec. B; *coeff. stœchiométrique de molec.* B	v_B	
affinity; *affinité*	A	
extent of reaction; *état d'avancement d'une réaction*	ξ	
equilibrium constant; *constante d'équilibre*	K	
charge number of ion; *électrovalence d'un ion*	z	
Faraday constant; *constante de Faraday*	F	
ionic strength; *force ionique*	I	
activity of substance B; *activité de la substance* B: $z_B = (2\pi mkT/h^2)^{3/2}\lambda_B$	z_B	

8. RECOMMENDED MATHEMATICAL SYMBOLS.

8.1 *General symbols.*

equal to; *égal à*	$=$	
not equal to; *différent de*	=|=	$\neq$
identically equal to; *égal identiquement à*	$\equiv$	
corresponds to; *correspond à*	$\hat{=}$	

---

*) case of loosely coupled electron spin. **) case of tightly coupled electron spin
†) All energies are taken here with respect to the ground state as reference level.
††) For diatomic molecules use I and $A = h/8\pi^2 cI$.
*) n is used in chemistry, but v may be used as an alternative to n, when n is used for number density of particles.

approximately equal to; *égal environ à*	$\approx$	
asymptotically equal to; *asymptotiquement égal à*	$\simeq$	
proportional to; *proportionnel à*	$\sim$	$\propto$
approaches; *tend vers*	$\rightarrow$	
larger than; *supérieur á*	$>$	
smaller than; *inférieur á*	$<$	
much larger than; *très supérieur á*	$\gg$	
much smaller than; *très inférieur á*	$\ll$	
larger than or equal to; *supérieur ou égal á*	$\geqslant$	$\geqq$ $\geq$
smaller than or equal to; *inférieur ou égal á*	$\leqslant$	$\leqq$ $\leq$
plus; *plus*	$+$	
minus; *moins*	$-$	
plus or minus; *plus ou moins*	$\pm$	
a multiplied by b; *a multiplié par b*	ab, $a.b$, $a \cdot b$, $a \times b$	
a divided by b; *a divisé par b*	a/b, $\frac{a}{b}$, ab^{-1}	
a raised to the power n; *a puissance n*	a^n	
magnitude of a; *valeur absolue de a*	$\lvert a \rvert$	
square root of a; *racine carrée de a*	$\sqrt{\bar{a}}$, $\sqrt{a}$, $a^{\frac{1}{2}}$	
mean value of a; *valeur moyenne de a*	$\bar{a}$ $\langle a \rangle$	
factorial p; *factorielle p*	$p!$	
binomial coefficient; *coefficient binomial:* $n!/p!(n-p)!$	$\binom{n}{p}$	
infinity; *infini*	∞	

8.2 Letter symbols and letter expressions for *mathematical operations* should be written in *roman* (or *upright*) type

exponential of x; *exponentielle de x*	$\exp x$, e^x	
base of natural logarithms; *base des logarithmes népériens*	e	
logarithm to the base a of x; *logarithme de base a de x*	$\log_a x$	
natural logarithm of x; *logarithme népérien de x*	$\ln x$	
common logarithm of x; *logarithme décimal de x*	$\lg x$, $\log x$	*)
binary logarithm of x; *logarithme binaire de x*	$\mathrm{lb}\ x$ $\log_2 x$	
summation; *somme*	Σ	
product; *produit*	Π	
finite increase of x; *accroissement fini de x*	Δx	**)
variation of x; *variation de x*	δx	
total differential of x; *différentielle totale de x*	$\mathrm{d}x$	
function of x; *fonction de x*	$f(x)$, $\mathrm{f}(x)$	
limit of $f(x)$; *limite de* $f(x)$	$\lim f(x)$	
Dirac delta function; *fonction delta de Dirac* $\delta(\boldsymbol{r}) = \delta(\mathrm{x})\delta(\mathrm{y})\delta(\mathrm{z})$	$\delta(x)$, $\delta(\boldsymbol{r})$	
Kronecker delta symbol; *symbole delta de Kronecker*	δ_{ij}	
Unit step function; *fonction unité*($\epsilon(x) = 1$ for $x > 0$, $\epsilon(x) = 0$ for $x < 0$)	$\epsilon(x)$	†)

8.3 Trigonometric functions.

sine of x, *sinus x*	$\sin x$
cosine of, *cosinus x*	$\cos x$
tangent of x, *tangente x*	$\tan x$, $\mathrm{tg}\ x$
cotangent of x, *cotangente x*	$\cot x$, $\mathrm{ctg}\ x$
secant of x, *sécante x*	$\sec x$
cosecant of x, *cosécante x*	$\mathrm{cosec}\ x$

Remarks:

a. It is recommended to use for the *inverse circular functions* the symbolic expressions for the corresponding circular function preceded by the letters: arc.
Examples: $\arcsin x$, $\arccos x$, $\arctan x$ or $\mathrm{arctg}\ x$, etc. Sometimes the notation $\sin^{-1} x$, $\tan^{-1} x$, etc. is used.

b. It is recommended to use for the *hyperbolic functions* the symbolic expressions for the corresponding circular function, followed by the letter: h.
Examples: $\sinh x$, $\cosh x$, $\tanh x$ or $\mathrm{tgh}\ x$, etc.

c. It is recommended to use for the *inverse hyperbolic functions* the symbolic expression for the corresponding hyperbolic function preceded by the letters: ar.

Example: $\mathrm{arsinh}\ x$, $\mathrm{arcosh}\ x$, etc.

8.4 Complex quantities.

imaginary unit; *unité imaginaire* ($\mathrm{i}^2 = -1$)	i, j
real part of z; *partie réelle de z*	$\mathrm{Re}\ z$, z
imaginary part of z; *partie imaginaire de z*	$\mathrm{Im}\ z$, z''
modulus of z; *module de z*	$\lvert z \rvert$
argument of z; *argument de z* : $z = \lvert z \rvert \exp \mathrm{i}\varphi$	$\arg z$, φ
complex conjugate of z, conjugate of z; *complexe conjugué de z, conjugué de z*	z^*

Remark: Sometimes the notation $\bar{z}$ is used for the complex conjugate of z.

*) In case of ambiguity $\log_{10} x$. **) Greek capital delta, not triangle.

†) $\Theta(t)$ is used for unit step function of time.

8.5 *Symbols for special values of periodic quantities.*

	Normal case		Exceptional case	
instantaneous value	x	x	x	x
r.m.s. value	x_{eff}	$\tilde{x}$	X	X
maximum value	x_{m}	$\hat{x}$	$x_{\mathrm{m}}, X_{\mathrm{m}}$	$\hat{x}, \hat{X}$
average value	x_{av}	$\bar{x}, \langle x \rangle$	x_{av}	$\bar{x}, \langle x \rangle$

Remarks:

a. The "normal" case is the case in which only a small or only a capital letter may be used for the quantity. The "exceptional" case is the case in which both small and capital letters may be used for the same quantity.

b. The minimum value of x may be indicated by x_{min} or $\check{x}$.

c. The r.m.s.value is defined as $\tilde{x}^2 = T^{-1} \int_0^T x(t)^2 \mathrm{d}t$.

d. The average value is defined as $\bar{x} = T^{-1} \int_0^T x(t) \mathrm{d}t$.

8.6 *Vector calculus.* (see also *1.2.3*)

absolute value; *valeur absolue*	$\lvert \boldsymbol{A} \rvert, A$
differential vector operator; *vecteur opérateur différentiel*	$\partial/\partial \boldsymbol{r}, \nabla$
gradient; *gradient*	grad $\varphi, \nabla\varphi$
divergence; *divergence*	div $\boldsymbol{A}, \nabla\cdot\boldsymbol{A}$
curl; *rotationnel*	curl $\boldsymbol{A}$, rot $\boldsymbol{A}, \nabla \times \boldsymbol{A}$
Laplacian; *Laplacien*	$\triangle\varphi, \nabla^2\varphi$
Dalembertian; *Dalembertien*	$\square\varphi$

8.7 *Matrix calculus.*

transpose of matrix A; *matrice transposée de* A: $\tilde{A}_{ij} = A_{ji}$	$\tilde{A}$
complex conjugate of A; *matrice complexe conjugueé de* A: $A^*_{ij} = (A_{ij})^*$	A^*
Hermitian conjugate of A; *matrice conjugueé Hermitienne de* A: $A\dagger_{ji} = A_{ji}^*$	$A\dagger$
Pauli matrices; *matrices de Pauli:*	σ, $\sigma_x, \sigma_y, \sigma_z$

$$\sigma_x = \begin{vmatrix} 0 & 1 \\ 1 & 0 \end{vmatrix} \qquad \sigma_y = \begin{vmatrix} 0 & -\mathrm{i} \\ \mathrm{i} & 0 \end{vmatrix} \qquad \sigma_z = \begin{vmatrix} 1 & 0 \\ 0 & -1 \end{vmatrix}$$

$\sigma_1, \sigma_2, \sigma_3$

unit matrix; *matrice unité:* $I = \begin{vmatrix} 1 & 0 \\ 0 & 1 \end{vmatrix}$ $\qquad I$

Dirac (4 × 4) matrices; (4 × 4) *matrices de Dirac* *)

$$\alpha_x = \begin{vmatrix} 0 & \sigma_x \\ \sigma_x & 0 \end{vmatrix} \qquad x_y = \begin{vmatrix} 0 & \sigma_y \\ \sigma_y & 0 \end{vmatrix} \qquad \alpha_z = \begin{vmatrix} 0 & \sigma_z \\ \sigma_z & 0 \end{vmatrix}$$

$\alpha, \alpha_x, \alpha_y, \alpha_z$

$$\beta = \begin{vmatrix} I & 0 \\ 0 & -I \end{vmatrix}$$

β

9. INTERNATIONAL SYMBOLS FOR UNITS.

9.1 *Unit systems.*

1. A *coherent system of units* is a system based on a certain set of "basic units" from which all "derived units" are obtained by multiplication or division without introducing numerical factors. In addition there are "dimensionless units," in particular the radian, symbol: rad, for plane angle and the steradian, symbol: sr, for solid angle.

2. The ***CGS system*** or cm-g-s system is a coherent system of units based on *three basic units* for the three basic quantities length, mass and time respectively:

centimetre	cm
gramme	g
second	s

---

*) Sometimes a different representation is used.

In the field of *mechanics* the following units of this system have special names and symbols, which have been approved by the Conférence Générale des Poids et Mesures:

l, b, h	centimetre; *centimètre*	cm
t	second; *seconde*	s
m	gramme; *gramme*	g
f, v	hertz; *hertz* (= s^{-1})	Hz
F	dyne; *dyne* (= $g.cm/s^2$)	dyn
E, U, W, A	erg; *erg* (= $g.cm^2/s^2$)	erg
p	microbar; *microbar* (= dyn/cm^2)	μbar
η	poise; *poise* (= $dyn.\ s/cm^2$)	P

In the field of *electricity and magnetism* several variants of the CGS unit system have been developed, in particular the *electrostatic CGS system* and *electromagnetic CGS system*. Special names and symbols for some of the units of the second system are:*)

*H**	oersted; *oersted* (= $cm^{-}.g^{\frac{1}{2}}.s^{-1}$)	Oe
*B**	gauss; *gauss* (= $cm^{-\frac{1}{2}}.g^{\frac{1}{2}}.s^{-1}$)	G
Φ*	maxwell; *maxwell* (= $cm^{\frac{3}{2}}.g^{\frac{1}{2}}s^{-1}$)	Mx

For further information about the units and unit systems in electricity and magnetism see appendix, section 2.

3. The ***MKSA system*** or m-kg-s-A system is a coherent system of units for mechanics, electricity and magnetism, based on *four basic units* for the four basic quantities length, mass, time and electric current intensity:

metre	m
kilogramme	kg
second	s
ampere	A

Remark: The system based on these four units has been given the name *Giorgi system* by the International Electrotechenical Committee in 1958. The subsystem for mechanics, which is based on the first three units only, has the name *MKS system.*

The following units of the MKSA system have special names and symbols, which have been approved by the Conférence Générale des Poids et Measures:

l. b. h	metre; *mètre*	m
t	second; *seconde*	s
m	kilogramme; *kilogramme*	kg
v, f	hertz; *hertz* (= s^{-1})	Hz
F	newton; *newton* (= $kg.m/s^2$)	N
E	joule; *joule* (= $kg.m^2/s^2$)	J
P	watt; *watt* (= J/s)	W
I	ampere; *ampère*	A
Q	coulomb; *coulomb* (= A.s)	C
V	volt; *volt* (= W/A)	V
C	farad; *farad* (= C/V)	F
R	ohm; *ohm* (= V/A)	Ω
L	henry; *henry* (= V.s/A)	H
Φ	weber; *weber* (= V.s)	Wb
B	tesla; *tesla* (= Wb/m^2)	T

4. The ***degree Kelvin.*** In the field of *thermodynamics* one introduces an additional basic unit, corresponding to the basic quantity:

thermodynamic temperature, the unit being the degree Kelvin, symbol: °K
When the *customary temperature* is used, defined by $t = T - T_0$, where $T_0 = 273.15°K$, this is usually expressed in degree Celsius symbol: °C. For *temperature interval* the name degree, symbol: deg is often used, the indications "Kelvin" or "Celsius," indicating the zeropoint of the temperature scale used, being irrelevant in this case.

5. The ***candela.***

In the field of *photometry* one introduces an additional basic unit, corresponding to the basic quantity: *luminous intensity*, this unit being the candela, symbol: cd. Special names and symbols for units in this field are:

I	candela; *candéla*	cd
Φ	lumen; *lumen*	lm
E	lux; *lux* (= lm/m^2)	lx

---

*) See also Appendix.

6. The ***International System of Units.*** For the coherent system based on the six basic units:

metre	m	ampere	A
kilogramme	kg	degree Kelvin	°K
second	s	candela	cd

the name *International System of Units* has been recommended by the Conférence Générale des Poids et Mesures in 1960. The units of this system are called: *SI-units*

7. The ***mole.***

In the field of *chemical and molecular physics*, in addition to the basic quantities defined above having units defined by the Conférence Générale des Poids et Mesures, *amount of substance* is also treated as a basic quantity. The recommended basic unit is the mole, symbol: mol. The mole is defined as the amount of substance of a system, which contains the same number of molecules (or ions, or atoms, or electrons, as the case may be), as there are atoms in exactly 12 gramme of the pure carbon nuclide ^{12}C.

9.2 Other units.

l	angström; *angström*	Å
σ	barn; *barn* (= 10^{-24} cm^2)	b
V	litre; *litre*	l
$t, \tau, T_{\frac{1}{2}}$	minute; *minute*	min
$t, \tau, T_{\frac{1}{2}}$	hour; *heure*	h
$t, \tau, T_{\frac{1}{2}}$	day; *jour*	d
$t, \tau, T_{\frac{1}{2}}$	year; *année*	a
p	atmosphere; *atmosphère*	atm
E	kilowatt-hour; *kilowatt-heure*	kWh
Q	calorie; *calorie*	cal
E ,Q	electronvolt; *électronvolt*	eV
m	tonne; *tonne* (= 1000 kg)	t
m_a	(unified) atomic mass unit; *unité de masse atomique (unifiée)*	u
p	bar; *bar* (= 10^6 dyn/cm^2)	bar
A	curie, *curie*	Ci

Remark: The (unified) atomic mass unit is defined as $\frac{1}{12}$th of the mass of an atom of the ^{12}C nuclide.

APPENDIX*). SYSTEMS OF QUANTITIES AND UNITS IN ELECTRICITY AND MAGNETISM.

The CGS unit system with three basic units and the MKSA unit system with four basic units correspond respectively to two different sets of equations in the field of electricity and magnetism, which are developed starting from three and from four basic quantities respectively. These systems are denoted as three and four "dimensional" systems of equations respectively.

1. Systems of equations with 3 basic quantities.

Three distinct sets of equations with three basic quantities**) have been developed in the field of electricity and magnetism. These are:

(1.a) *The "electrostatic system" of equations*, defining the electric charge on the basis of Coulomb laws for the force between two electric charges, by taking the permittivity in vacuo equal to a dimensionless quantity, the number unity.

(1.b) *The "electromagnetic system" of equations*, defining the electric current on the basis of the interaction law for the force between two electric current elements, by taking the permeability in vacuo equal to a dimensionless quantity, the number unity.

(1.c) *The "symmetrical system" or Gaussian system of equations*, using the electric quantities from system (1.a) and the magnetic quantities from system (1.b). As a result of combining the two sets of quantities the velocity of light in vacuo appears explicitly in some of the equations interrelating electric and magnetic quantities.

The equations in these three systems are usually written in the "*non-rationalized*" form, which is called "non-rationalized," because in these equations often factors 2π or 4π appear in situations not involving circular or spherical symmetry respectively. These equations are sometimes written in a "*rationalized*" form, in which these factors appear only in those equations, where they could be expected from the geometry of the system. When three dimensional equations are used (e.g. in theoretical physics), one commonly uses those of the *non-rationalized symmetrical system.*

2. Systems of equations with 4 basic quantities.

In the equations with four basic quantities at least one quantity of electric or magnetic nature is included in the basic set. In such a system the permittivity and the permeability in vacuo appear explicitly as physical quantities with dimension in the relevant equations.

[*] The S.U.N. commission, after reproducing in the previous chapters all the recommendations on symbols, units and nomenclature approved by the I.U.P.A.P., gives in this Appendix some factual information about existing systems of quantities and units in the field of electricity and magnetism.

[**] Often length, time and mass are chosen as basic quantities, but also other choices, e.g. length, time and energy or length, time and force have been used.

Two different sets of equations are in use:

(2.a) The *"non-rationalized system" of equations*, in which the factors 4π and 2π often appear at unexpected places.

(2.b) The *"rationalized system" of equations*, in which these factors only appear in those equations, where they could be expected from the geometry.

When four-dimensional equations are used, one commonly writes these equations in the rationalized form (2.b).

Some characteristic expressions of the non rationalized three-dimensional "symmetrical system" (1.c) and the corresponding four-dimensional equations in the non-rationalized form (2.a) and the rationalized form (2.b) are given in the table. The quantities of the three-dimensional "symmetrical system" of equations (1.c) have been indicated with an asterisk (*), those of the non-rationalized four-dimensional equations (2.a) with a prime ($'$), as far as they are different from those of the system (2.b).

Non-rationalized symmetric system with 3 basic quantities	Non-rational. system with 4 basic quantities	Rationalized system with 4 basic quantities
$c \operatorname{rot} \boldsymbol{E}^* = -\partial \boldsymbol{B}^*/\partial t$	$\operatorname{rot} \boldsymbol{E} = -\partial \boldsymbol{B}/\partial t$	$\operatorname{rot} \boldsymbol{E} = -\partial \boldsymbol{B}/\partial t$
$\operatorname{div} \boldsymbol{D}^* = 4\pi\rho$	$\operatorname{div} \boldsymbol{D}' = 4\pi\rho$	$\operatorname{div} \boldsymbol{D} = \rho$
$\operatorname{div} \boldsymbol{B}^* = 0$	$\operatorname{div} \boldsymbol{B} = 0$	$\operatorname{div} \boldsymbol{B} = 0$
$c \operatorname{rot} \boldsymbol{H}^* = 4\pi \boldsymbol{j}^* + \partial \boldsymbol{D}^*/\partial t$	$\operatorname{rot} \boldsymbol{H}' = 4\pi \boldsymbol{j} + \partial \boldsymbol{D}'/\partial t$	$\operatorname{rot} \boldsymbol{H} = \boldsymbol{j} + \partial \boldsymbol{D}/\partial t$
$\boldsymbol{F} = Q^* \boldsymbol{E}^* + Q^* \boldsymbol{v} \times \boldsymbol{B}^*/c$	$\boldsymbol{F} = Q\boldsymbol{E} + Q\boldsymbol{v} \times \boldsymbol{B}$	$\boldsymbol{F} = Q\boldsymbol{E} + Q\boldsymbol{v} \times \boldsymbol{B}.$
$w = (\boldsymbol{E}^*.\boldsymbol{D}^* + \boldsymbol{B}^*.\boldsymbol{H}^*)/8\pi$	$w = (\boldsymbol{E}.\boldsymbol{D}' + \boldsymbol{B}.\boldsymbol{H}')/8\pi$	$w = (\boldsymbol{E}.\boldsymbol{D} + \boldsymbol{B}.\boldsymbol{H})/2$
$\boldsymbol{S} = c(\boldsymbol{E}^* \times \boldsymbol{H}^*)/4\pi$	$\boldsymbol{S} = (\boldsymbol{E} \times \boldsymbol{H}')/4\pi$	$\boldsymbol{S} = \boldsymbol{E} \times \boldsymbol{H}$
$\boldsymbol{E}^* = -\operatorname{grad} V^* - (1/c)\partial \boldsymbol{A}^*/\partial t$	$\boldsymbol{E} = -\operatorname{grad} V - \partial \boldsymbol{A}/\partial t$	$\boldsymbol{E} = -\operatorname{grad} V - \partial \boldsymbol{A}/\partial t$
$\boldsymbol{B}^* = \operatorname{rot} \boldsymbol{A}^*$	$\boldsymbol{B} = \operatorname{rot} \boldsymbol{A}$	$\boldsymbol{B} = \operatorname{rot} \boldsymbol{A}$
$\epsilon_r \boldsymbol{E}^* = \boldsymbol{D}^*$	$\epsilon_0' \epsilon_r \boldsymbol{E} = \epsilon' \boldsymbol{E} = \boldsymbol{D}'$	$\epsilon_0 \epsilon_r \boldsymbol{E} = \epsilon \boldsymbol{E} = \boldsymbol{D}$
$\boldsymbol{E}^* = \boldsymbol{D}^* - 4\pi \boldsymbol{P}^*$	$\epsilon_0' \boldsymbol{E} = \boldsymbol{D}' - 4\pi \boldsymbol{P}$	$\epsilon_0 \boldsymbol{E} = \boldsymbol{D} - \boldsymbol{P}$
$\boldsymbol{B}^* = \mu_r \boldsymbol{H}^*$	$\boldsymbol{B} = \mu' \boldsymbol{H}' = \mu_0' \mu_r \boldsymbol{H}'$	$\boldsymbol{B} = \mu \boldsymbol{H} = \mu_0 \mu_r \boldsymbol{H}$
$\boldsymbol{B}^* = \boldsymbol{H}^* + 4\pi \boldsymbol{M}^*$	$\boldsymbol{B} = \mu_0'(\boldsymbol{H}' + 4\pi \boldsymbol{M})$	$\boldsymbol{B} = \mu_0(\boldsymbol{H} + \boldsymbol{M})$
$a_0 = \hbar^2/me^{*2}$	$a_0 = \hbar^2 \epsilon_0'/me^2$	$a_0 = \hbar^2 4\pi\epsilon_0/me^2$
$hcR_\infty = e^{*2}/2a_0$	$hcR_\infty = e^2/2\epsilon_0' a_0$	$hcR_\infty = e^2/8\pi\epsilon_0' a_0$
$\mu_B{}^* = e^*\hbar/2mc$	$\mu_B = e\hbar/2m$	$\mu_B = e\hbar/2m$
$\gamma^* = g(e^*/2mc)$	$\gamma = g(e/2m)$	$\gamma = g(\epsilon/2m)$
$\omega_L = (e^*/2mc)B^*$	$\omega_L = (e/2m)B =$	$\omega_L = (e/2m)B =$
$= \mu_B{}^* B^*/\hbar$	$= \mu_B B/\hbar$	$= \mu_B B/\hbar$
$\alpha = e^{*2}/\hbar c$	$\alpha = e^2/\epsilon_0' \hbar c$	$\alpha = e^2/4\pi\epsilon_0 \hbar c$
$r_e = e^{*2}/mc^2$	$r_e = e^2/\epsilon_0' mc^2$	$r_e = e^2/4\pi\epsilon_0 mc^2$

Remark on rationalization:

The basis of these considerations in which the rationalization is connected with the writing of the equations between physical quantities is in agreement with the resolution accepted by the I.U.P.A.P. in 1951 in Copenhagen:

"The General Assembly of the Union of Physics considers that, in the case that the equations are rationalized, the rationalization should be effected by the introduction of new quantities."

("L'Assemblée Générale de l'Union de Physique considère que, dans le cas où les équations sont rationalisées, la rationalisation doit étre obtenue par l'introduction de grandeurs nouvelles.")

3. *CGS system of units.*

(3.a) The *electrostatic CGS system of units* forms a coherent system of units in combination with the three-dimensional "electrostatic system" of equations (1.a).

(3.b) The *electromagnetic CGS system of units* forms a coherent system of units in combination with the three-dimensional "electromagnetic system" of equations (1.b).

(3.c) The *mixed CGS system of units*, called *Gaussian units*, consisting of the set of electric units of the electrostatic CGS system on the one hand and the set of magnetic units of the electromagnetic CGS system on the other hand, form together also a coherent system of units, when used in combination with the three-dimensional "symmetrical system" of equations (1.c).

4. *MKSA system of units.*

The MKSA system of units forms a coherent system of units in either of the four-dimensional systems of equations mentioned under 2.

The MKSA system is, however, most commonly used together with the rationalized (four-dimensional) equations (2.b).

5. *centimetre-gramme-second-franklin system and centimetre-gramme-second-biot system*

Several investigators have pointed out over many years the advantages, which result from the use of the four-dimensional equations, i.e. equations with four basic quantities from which at least one is of electrical nature. These advantages are partly of a didactical nature, but many investigators consider the usage of four basic quantities also important for developing a clear representation of the field of electricity and magnetism.

It has often been considerèd as a disadvantage that the transition from the three- to the four-dimensional system of equations should be tied to the transition from the CGS system of units to the MKSA system of units as explained under 3, and 4, which as a consequence leads to a change in the numerical value of many well known physical quantities.

For that reason several investigators have advocated the introduction of a four-dimensional system of units, which is a generalization of the CGS system. This unit-system is chosen so that to any unit of the CGS system (with three basic units) there corresponds one particular unit of this "generalized CGS system" (with four basic units), such that the *numerical* values of the physical quantities in the field of electricity are invariant.

The introduction of such a "generalized CGS system" has the advantage that the relation between the units of this "generalized CGS system" and the units of the MKSA system can be expressed by ordinary conversion equations.

The use of the four-dimensional system of equations (with four basic quantities) accompanied by the usage of such a "generalized CGS system" of units (with four basic units) is therefore of advantage as an intermediate representation in this period of coexistence of the CGS system and the MKSA system, where transitions from one system to the other often have to be made.

As a result of all these considerations the General Assembly of the IUPAP, Copenhagen, 1951, approved by its resolution 5 the introduction of the following two "generalized CGS systems" based on four basic units:

(5.a) The system with the *centimetre, gramme, second* and the charge corresponding to one *electrostatic unit*, as basic units, being a 4-dimensional generalization of the electrostatic CGS system (3.a)

(5.b) The system with the *centimetre, gramme second* and the current corresponding to one *electromagnetic unit* or deca-ampere, as basic units, being a 4-dimensional generalization of the electromagnetic CGS system (3.b)

In practical applications of these systems it is of advantage to indicate the *basic electrical unit* in each of these two systems with a name and symbol.

The name franklin was proposed in 1941 for the electrostatic unit of electric charge considered as a basic unit of the system (5.a). The franklin, symbol: Fr, is thus defined as:

> The *franklin* is that charge, which exerts on an equal charge at a distance of 1 centimetre in vacuo a force of 1 dyne.
>
> According to this definition 1 franklin = $(10/\zeta)$ coulomb, where $\zeta = 2.997925 \times 10^{10}$ is the numerical value of the velocity of light in vacuum, measured in cm/s.

For the electromagnetic unit of electric current, considered as a basic unit of the system (5.b), the name biot has been used. The biot, symbol: Bi, is thus defined as:

> The *biot* is that constant current intensity, which, when maintained in two parallel infinitely long rectilinear conductors of infinite length and of negligible circular section, placed at a mutual distance of 1 centimetre apart in vacuo, would produce between these conductors a force of 2 dyne per centimetre length.
>
> According to this definition 1 biot = 10 ampere).

These unit systems (5.a) and (5.b) are referred to as cm-g-s-Fr system and cm-g-s-Bi system respectively.

The definitions of the franklin in the system (5.a) and that of the biot in the system (5.b) which closely correspond to the electrostatic CGS unit of charge and the electromagnetic CGS unit of current respectively, ensure that the quantities of the *non-rationalized* four-dimensional system of equations (second column, table p. 27), when expressed in these units, have the same numerical value as the corresponding quantities of the non-rationalized three-dimensional system of equations (first column, table p. 27), when expressed in the corresponding CGS units.

Some of the units of the three-dimensional CGS system and the corresponding units of the two four-dimensional systems are given in the table:

	three-dimensional unit of mixed CGS system		corresponding four-dimensional unit of generalized CGS system
Q^*	$\mathrm{erg}^{\frac{1}{2}} \cdot \mathrm{cm}^{\frac{1}{2}}$	Q	Fr
I^*	$\mathrm{erg}^{\frac{1}{2}} \cdot \mathrm{cm}^{\frac{1}{2}}\ \mathrm{s}^{-1\frac{1}{2}}$	I	Fr/s
V^*	$\mathrm{erg}^{\frac{1}{2}} \cdot \mathrm{cm}^{-\frac{1}{2}}$	V	erg/Fr
$\boldsymbol{E}^*$	$\mathrm{erg}^{\frac{1}{2}} \cdot \mathrm{cm}^{-\frac{3}{2}}$	$\boldsymbol{E}$	dyn/Fr
$\boldsymbol{D}^*$	$\mathrm{erg}^{\frac{1}{2}} \cdot \mathrm{cm}^{-\frac{3}{2}}$	$\boldsymbol{D}'$	$\mathrm{Fr/cm^2}$
C^*	cm	C	$\mathrm{Fr^2/erg}$
ϵ_r	1	ϵ'	$\mathrm{Fr^2/erg \cdot cm}$
$\boldsymbol{B}^*$	G	$\boldsymbol{B}$	dyn/Bi · cm
$\boldsymbol{H}^*$	Oe	$\boldsymbol{H}'$	Bi/cm
μ_r	1	μ'	$\mathrm{dyn/Bi^2}$

AMERICAN STANDARD ABBREVIATIONS FOR SCIENTIFIC AND ENGINEERING TERMS

Reproduced by permission of The American Society of Mechanical Engineers

Introductory Notes

Scope and Purpose

1. The Executive Committee of the Sectional Committee on Scientific and Engineering Symbols and Abbreviations has made the following distinction between symbols and abbreviations: Letter symbols are letters used to represent magnitudes of physical quantities in equations and mathematical formulas. Abbreviations are shortened forms of names or expressions employed in texts and tabulations, and should not be used in equations.

Fundamental Rules

2. Abbreviations should be used sparingly in text and with due regard to the context and to the training of the reader. Terms denoting units of measurement should be abbreviated in the text only when preceded by the amounts indicated in numerals; thus "several inches," "one inch," "12 in." In tabular matter, specifications, maps, drawings, and texts for special purposes, the use of abbreviations should be governed only by the desirability of conserving space.

3. Short words such as ton, day, and mile should be spelled out.

4. Abbreviations should not be used where the meaning will not be clear. In case of doubt, spell out.

5. The same abbreviation is used for both singular and plural, as "bbl" for barrel and barrels.

6. The use of conventional signs for abbreviations in text is not recommended; thus "per," not /; "lb," not #; "in," not ″. Such signs may be used sparingly in tables and similar places for conserving space.

7. The period should be omitted except in cases where the omission would result in confusion.

8. The letters of such abbreviations as ASA should not be spaced (not A S A).

9. The use in text of exponents for the abbreviations of square and cube and of the negative exponents for terms involving "per" is not recommended. The superior figures are usually not available on the keyboards of typesetting and linotype machines and composition is therefore delayed. There is also the liklihood of confusion with footnote reference numbers. These shorter forms are permissible in tables and are sometimes difficult to avoid in text.

10. A sentence should not begin with a numeral followed by an abbreviation. Abbreviations for names of units are to be used only after numerical values, such as 25 ft or 110 v.

Abbreviations*

absolute	abs
acre	spell out
acre-foot	acre-ft
air horsepower	air hp
alternating-current (as adjective)	a-c
ampere	amp
ampere-hour	amp-hr
amplitude, an elliptic function	am.
Angstrom unit	A
antilogarithm	antilog
atmosphere	atm
atomic weight	at. wt
average	avg
avoirdupois	avdp
azimuth	az or α
barometer	bar.
barrel	bbl
Baumé	Bé
board feet (feet board measure)	fbm
boiler pressure	spell out
boiling point	bp
brake horsepower	bhp
brake horsepower-hour	bhp-hr
Brinell hardness number	Bhn
British thermal unit[1]	Btu or B
bushel	bu
calorie	cal
candle	c
candle-hour	c-hr
candlepower	cp
cent	c or ¢
center to center	c to c
centigram	cg
centiliter	cl
centimeter	cm
centimeter-gram-second (system)	cgs
chemical	chem
chemically pure	cp
circular	cir
circular mils	cir mils
coefficient	coef
cologarithm	colog
concentrate	conc
conductivity	cond
constant	const
continental horsepower	cont hp
cord	cd
cosecant	csc
cosine	cos
cosine of the amplitude, an elliptic function	cn
cost, insurance, and freight	cif
cotangent	cot
coulomb	spell out
counter electromotive force	cemf
cubic	cu
cubic centimeter	cu cm, cm^3 (liquid, meaning milliliter, ml)
cubic foot	cu ft
cubic feet per minute	cfm
cubic feet per second	cfs
cubic inch	cu in.
cubic meter	cu m or m^3
cubic micron	cu μ or cu mu or μ^3
cubic millimeter	cu mm or mm^3
cubic yard	cu yd
current density	spell out
cycles per second	spell out or c
cylinder	cyl
day	spell out
decibel	db
degree[1]	deg or °
degree centigrade	C
degree Fahrenheit	F
degree Kelvin	K
degree Réaumur	R
delta amplitude, an elliptic function	dn
diameter	diam
direct-current (as adjective)	d-c
dollar	$
dozen	doz
dram	dr

---

* These forms are recommended for readers whose familiarity with the terms used makes possible a maximum of abbreviations. For other classes of readers editors may wish to use less contracted combinations made up from this list. For example, the list gives the abbreviation of the term "feet per second" as "fps." To some readers ft per sec will be more easily understood.

[1] Abbreviation recommended by the A.S.M.E. Power Test Codes Committee. B = 1 Btu, kB = 1000 Btu, mB = 1,000,000 Btu. The A.S.H. &V.E. recommends the use of Mb = 1000 Btu and Mbh = 1000 Btu per hr.

---

[1] There are circumstances under which one or the other of these forms is preferred. In general the sign ° is used where space conditions make it necessary, as in tabular matter, and when abbreviations are cumbersome, as in some angular measurements, i.e., 59° 23′ 42″. In the interest of simplicity and clarity the Committee has recommended that the abbreviation for the temperature scale, F, C, K, etc., always be included in expressions for numerical temperatures, but, wherever feasible, the abbreviation for "degree" be omitted; as 69 F.

[*] The International Commission on Illumination has changed the symbol for lumen to lm, and the symbol for lumen-hour to lm-hr. This nomenclature is used in American Standard for Illuminating Engineering Nomenclature and Photometric Standards (ASA Z7.1–1942).

ABBREVIATIONS OF COMMON UNITS OF WEIGHT AND MEASURE

From NBS Miscellaneous Publication No. 233.

Spelling and Abbreviations of Units

The spelling of the names of units as adopted by the National Bureau of Standards is that given in the list below. The spelling of the metric units is in accordance with that given in the law of July 28, 1866, legalizing the metric system in the United States.

Following the name of each unit in the list below is given the abbreviation which the Bureau has adopted. Attention is particularly called to the following principles:

1. The period is omitted after all abbreviations of units, except where the abbreviation forms an English word.
2. The exponents “^{2}” and “^{3}” are used to signify “square” and “cubic,” respectively, instead of the abbreviations “sq” or “cu,” which are, however, frequently used in technical literature for the United States customary units. In conformity with this principle the abbreviation for cubic centimeter is “cm^3” (instead of “cc” or “c cm”). The term “cubic centimeter,” as used in chemical work, is, in fact, a misnomer, since the unit actually used is the “milliliter” of which “ml” is the correct abbreviation.
3. The use of the same abbreviation for both singular and plural is recommended. This practice is already established in expressing metric units and is in accordance with the spirit and chief purpose of abbreviations.
4. It is also suggested that, unless all the text is printed in capital letters, only small letters be used for abbreviations, except in such case as, A for angstrom, etc., where the use of capital letters is general.

LIST OF THE MOST COMMON UNITS OF WEIGHT AND MEASURE AND THEIR ABBREVIATIONS

Unit	Abbreviation	Unit	Abbreviation
acre	acre	kiloliter	kl
angstrom	A	kilometer	km
are	a	link	li
avoirdupois	avdp	liquid	liq

* Stricken or struck bushel. A heaped bushel for apples of 2747.715 cu. inches was established by the U.S. Court of Customs Appeals on Feb. 15, 1912. A heaped bushel equal to 1¼ stricken bushels is also known.

** This is the calorie as defined by the U.S. National Bureau of Standards and is equal to 4.18400 joules.

DIMENSIONLESS GROUPS

John P. Catchpole and George Fulford

Reprinted from Industrial & Engineering Chemistry, Vol. 58, No. 3, pp. 47 to 60. Copyright 1966 by the American Chemical Society and reprinted by permission of the copyright owners and the authors. See also the Supplementary Table which follows this table.

Dimensionless groups are frequently generated in the analysis of a complex engineering problem. The more common groups thus generated are easily recognized, while the less common ones are not. Unless the less common existing groups are recognized, an already named group could unknowingly be renamed. Table A provides a tool that may be used to avoid this occurrence, by listing the groups by the variables of which they consist. These variables—i.e., length, density, diffusivity, viscosity, etc.—are further subdivided into their exponents to which they are raised in the groups in question. Thus, Reynolds number is listed under the exponent +1 for the variables, length, fluid velocity, and density, and the exponent −1 for viscosity.

To illustrate the use of the tables in the analysis of a problem, the group $(kE/\eta\sigma T^3)$ might be generated in the solution of a complex heat transfer problem. From Table A the groups containing the constituent variables are checked and the groups are listed:

Thermal conductivity	(k^{+1})	**F11**, **L7**, **R1**
Modulus of elasticity	(E^{+1})	**C1**, **E13**, **R1**
Stefan-Boltzmann coefficient	(η^{-1})	**R1**, **T6**
Surface tension	(σ^{-1})	**B9**, **C3**, **E8**, **L6**, **R1**, **W1**
Temperature	(T^{-3})	**R1**, **T6**

It is immediately apparent that the only group common to all the categories listed is the Radiation number, **R1**, which is equivalent to the previously unidentified group.

The symbol assigned to a dimensionless group is usually the first two letters of its names. Several groups, however, have nonstandard symbols, particularly in the groups which are named after persons. These symbols are listed in the nomenclature.

NOMENCLATURE

a = annulus or clearance width, L
A = area, L^2
A^* = cooling area/unit volume, $1/L$
b = bearing breadth, L
B = groups **B6**, **B11**
c = specific heat, L^2/θ^2T
c_A = concentration, M/L^3
c_b = specific vapor capacity (mass/unit mass/unit pressure change), $L\theta^2/M$
$\left.\begin{matrix} c_d \\ c_D \end{matrix}\right\}$ = group **D13**
c_f = group **R9**
c_H = group **H4**
c_m = mass capacity, L^3/M
$\left.\begin{matrix} c_p \\ c_v \end{matrix}\right\}$ = specific heats at constant pressure and volume, L^2/θ^2T
c_q = heat capacity, L^2/θ^2T
c_Q = group **F9**
c_S = group **S11**
C = group **C10**, dimensional concentration, M/L^3
C_a = groups **C11**, **C4**
d = diameter, L
d_e = equivalent diameter (of particles, etc.), L
d_h = hydraulic diameter, L
D = diffusivity (molecular, unless noted otherwise), L^2/θ
D_{AB} = binary bulk diffusion coefficient, L^2/θ
D_{KA} = Knudsen diffusion coefficient, L^2/θ
e = voidage; porosity (⁻)
e^* = surface emissivity (⁻)
E = modulus of elasticity, $M/L\theta^2$
E_a = activation energy, L^2/θ^2
E_b = bulk modulus, $M/L\theta^2$
f = frequency, $1/\theta$, or Group **F1**
$f(M)$ = group **F11**
F = force, ML/θ^2
F_b = force per unit length of bearing, M/θ^2
$F(M)$ = group **F6**
F_R = resistance force in flow, ML/θ^2
g = acceleration due to gravity, L/θ^2
G = mass velocity (mass flux density; mass transfer coefficient), $M/\theta L^2$
h = heat transfer coefficient, $M/T\theta^3$
h_c = convective heat transfer coefficient, $M/T\theta^3$
H = energy change per unit mass ($= g \times$ head), L^2/θ^2
H' = fluid head, L
H_e = field strength, $Q/L\theta$
H_0 = homochronicity number
$I(M)$ = group **F8**
j = heat liberated per unit volume per unit time, $M/L\theta^3$
j_H, j_M = groups **J2**, **J3**
J = average free path/average velocity, θ, or group **L6**
k = thermal conductivity, $ML/T\theta^3$
k_c = mass transfer coefficient, L/θ
K = groups **K2**, **K10**, **N5**
K_1 = group **A4**
K_E = group **E4**
K_F = group **C2**
K_P = group **P13**
K_Q = group **H5**
K_r = group **E11**
$\bar{K}_\varepsilon$ = group **A1**
$\bar{K}_E$ = group **E4**
$\bar{K}_r$ = group **E12**
$\bar{K}_{rE}$ = group **E13**
$\bar{K}_s$ = group **R1**
$\bar{K}_\sigma$ = group **C1**
$\bar{K}_{\sigma\varepsilon}$ = group **C2**
L = characteristic dimension (except as noted), L
L_m = distance from midpoint to surface, L
m_T = group **T3**
M = group **M10**
M_H = group **H2**
n = concentration, wt./wt. (⁻)
n^* = specific mass content, mass/mass (⁻)
n_m = moisture content, wt./wt. bone dry gas (⁻)
N = rate of rotation, $1/\theta$, and groups **M3**, **N4**
N_{Bo} = groups **B7**, **B8**
N_c = group **C5**
N_{cl} = group **C10**
N_D = groups **D7**, **D14**
N_E = group **E1**
N_F = group **F4**
N_H = groups **H1**, **H9**
N_K = group **K1**
N_{KnA} = Knudsen number for diffusion (see Addendum)
N_1 = group **N2**
N_P = group **P7**
N_{rf} = group **R7**
N_{s1} = group **S8**
N_{s2} = group **S9**
N_T = group **N9**
P = pressure, $M/L\theta^2$
P = plasticity number (see Addendum)
p_b = bearing pressure, $M/L\theta^2$
p_s = static pressure, $M/L\theta^2$
p_v = vapor pressure, $M/L\theta^2$
p_σ = capillary pressure, $M/L\theta^2$
Δp_f = frictional pressure drop, $M/L\theta^2$
q = heat flux (heat flow/unit time), ML^2/θ^3
q^* = heat flux density (heat flux/unit area), M/θ^3
Q = heat liberated/unit mass, L^2/θ^2
r = latent heat of phase change, L^2/θ^2
r_v = heat of vaporization, L^2/θ^2
R = radius, L
R_H = hydraulic radius, L
R_2' = group **R5**
R_M = group **M7**
R_V = group **V3**
$\mathscr{R}$ = gas constant, L^2/θ^2T
s = humid heat, L^2/θ^2T
S = particle area/particle volume, L^2/L^3, and group **M6**
$\overline{St}$ = group **S14**
t = temperature, T
T = absolute temperature, T
$\Delta t, \Delta T$ = temperature difference, T
U^+ = group **P10**
U = reaction rate, $M/L^3\theta$
v_s = velocity of surface (solid), L/θ
V = fluid velocity, L/θ, and group **V1**
V_A = velocity of Alfven magnetic waves, L/θ
V_f = volumetric flow rate, L^3/θ
V_l = velocity of light, L/θ
V_m = mass flow rate, M/θ
V_s = velocity of sound, L/θ
w = circumferential velocity, L/θ
W = volume of system, L^3
W^* = gross volume, L^3
x = entry length; distance from entrance, L
y^+ = group **P11**
Z = group **O2**
α = thermal diffusivity (temperature conductivity), L^2/θ

DIMENSIONLESS GROUPS (Continued)

β = coefficient of bulk expansion, $1/T$, and group **D12**
β^* = Dufour coefficient, T
γ = specific gravity ($^-$) and group **R3**
$\dot{\gamma}$ = rate of shear, $1/\theta$
Γ = rate of change of temperature of medium, T/θ
δ = Soret or thermogradient coefficient, $1/T$, and group **D11**
Δ = difference in quantity
ε = height of roughness, L and group **A3**
ε_D = eddy mass diffusivity, L^2/θ
ζ = diffusion tortuosity ($^-$)
η = radiation coefficient (Stefan-Boltzmann coefficient), $M/T^4\theta^3$
θ = time, θ
θ_r = relaxation time, θ
λ = mean free path, L
μ = dynamic viscosity, $M/L\theta$
μ_e = magnetic permeability, ML/Q^2
μ_p = rigidity coefficient, $M/L\theta$
ξ = permeability, L^2

π = 3.1416.
Π = power to agitator or impeller, ML^2/θ^3
ρ = density, M/L^3
ρ_s = group **P3**
σ = surface tension, M/θ^2 and group **S12**
σ_c = group **C6**
σ_e = electrical conductivity, $Q^2\theta/L^3M$
σ_t = group **T4**
τ = group **T8**
τ_w = wall shear stress, $M/L\theta^2$
τ_y = yield stress, $M/L\theta^2$
φ = group **D9**
ψ = groups **N8**, **P14**, **R10**
ω = angular velocity (of fluid, unless noted otherwise), $1/\theta$
Ω = mass transfer potential (concn.), M/L^3
— (bar over) = mean value
N.B.: $(F) = \left|\frac{ML}{\theta^2}\right|;\ (H) = \left|\frac{ML^2}{\theta^2}\right|$

TABLES FOR IDENTIFYING DIMENSIONLESS GROUPS
TABLE A

PHYSICAL PROPERTIES
General Physical Properties

Parameter	Symbol	Dimensions	Exponent	Group
Coefficient of bulk expansion	β	$1/T$	−1	**E4, 12, G2**
			+1	**G5, R5, K9, 6**
Density	ρ	M/L^3	−2	**M1**
			−1	**A1, B1, 10, C1, 2, 6, D3, 13, E3, 9, 10, 13, F1, 11, H5, J1, K4, K10, L7, M3, 6, N2, 3, 4, P7, 9, R10, 13, S4, 13, 15**
			−2/3	**C9, J3**
			−1/2	**E2, L11, O2, P13**
			+1/3	**J3, K5, 53**
			+1/2	**D10, G3, P10, 11, R4, W2**
			+2/3	**F2, N8, S2**
			+1	**A5, B1, B6, 9, C5, 7, D5, 7, 13, E4, 6, 7, 8, H6, 11, J1, 3, 4, K1, L9, P1, R5, 11, 13, S17, T1, T6, V1, W1, W3**
			+2	**C10, G1, 5, K9, R5, 6, T2**
Density gradient	$d\bar{\rho}/dL$	M/L^4	+1	**R13**
Diffusivity (molecular unless noted otherwise)	D, a_m, ε_D	L^2/θ	−1	**B5, B7(4), D2, K4(1), K7(2), L2, 7, 10, N7, P2, P9, S4, 13**
			−2/3	**J3**
			−1/2	**T3**
			+1	**D12, F12(1), K7(3), L2(4), L9(1)**
Diffusivity (surface)	D_s	ML/θ^2	+1	**S18**
Diffusion tortuosity	ζ	—	−1	**K7**
Molecular weight	M	—	−1	**D14, K9, S6**
			+1	**D14**
Permeability (packed bed)	ξ	L^2	+1/2	**L_6**
Porosity (voidage)	e	—	−1	**B4**
			−1/2	**L_6**
			+1	**K7**
Specific weight	γ	—	±1/3	**F2**
Surface tension	σ	M/θ^2	−3	**C2**
			−2	**C1**
			−1	**B9, C3, 13, E8, L6, R1, W1, 3**
			−1/2	**D10, G3, O2, P13, R4, W2**
			+1	**M9, S17, 18**

(1) Coefficient of potential diffusion in mass transfer.
(2) Knudsen diffusion coefficient.
(3) Binary bulk diffusion coefficient.
(4) Effective diffusivity ($D + \varepsilon_D$) (molecular + eddy transfer).

PHYSICAL PROPERTIES
Electrical and Magnetic Properties

Parameter	Symbol	Dimensions	Exponent	Group
Current density	I	$Q/L^2\theta$	+1	**K10**
Electrical conductivity	σ_e	$Q^2\theta/L^3M$	−1	**E6**
			+1/2	**H2**
			+1	**L11, M3, 7**
Field strength	H_e	$Q/L\theta$	−2	**J4**
			+1	**H2, L11**
			+2	**K9, M3, 6, S6**
Magnetic permeability	μ_e	ML/Q^2	−1	**E5, J4**
			+1	**H2, M6, 7**
			+3/2	**L11**
			+2	**M3**
Voltage	E	$ML^2/Q\theta^2$	+1	**K10**

Thermal Properties

Parameter	Symbol	Dimensions	Exponent	Group
Humid heat	S	L^2/θ^2T	−1	**P15**
Latent heats of phase change	λ, r	L^2/θ^2	−1	**A3, E11, 12, 13, J1, K10, M1**
			+1	**B13, C9, K8, 11, N5**
Ratio of specific heats	γ	—	±1/2	**L5**
Specific heat	C, c	L^2/θ^2T	−1	**B2, 13, D3, 15, E1, F11, J2, K8, 11, L7, M10, N5, R3, S13**
			−1/3	**J2**
			+1/2	**F6, 7, 8**
			+2/3	**J2**
			+1	**A3, E4, 12, G4, J1, 4, L9, P1, 8, R3, 5, 6, 7**
Surface emissivity	e^*	-	−1	**T6**
Temperature conductivity (thermal diffusivity)	α	L^2/θ	−1	**L9, P1, 12, R5**
			+1	**C13, L7, 10**
Thermal conductivity	k or λ	$ML/T\theta^3$	−3	**M1**
			−2	**R6**
			−1	**B4, 12, C7, 9, 10, D4, G4, K3, L9, N6, P1, 5, 8, R5, S14**

Rheological and Elastic Behavior

Parameter	Symbol	Dimensions	Exponent	Group
Modulus of elasticity	E	$M/L\theta^2$	−1	**C5, E4, H11**
			+1	**C1, E13, R1**
			+3	**A1**
Rate of shear	γ	$1/\theta$	+1	**T8**
Rigidity coefficient	μ_p	$M/L\theta$	−2	**H6**
			−1	**B3**
			−1	**E5**
Shear stress	τ	$M/L\theta^2$	−1/2	**P10**
			+1/2	**P11**
Viscosity (in all cases kinematic viscosity has been written as μ/ρ)	μ	$M/L\theta$	−2	**A1, 5, G1, 5, K1, 9, S17, T2**
			−1	**B6, C10, D5, 7, E6, 7, H8, L1, 3, 9, O1, P4, 11, R5, 6, 11, S9, 19, T1, V1**

TABLE A (Continued)

Rheological and Elastic Behavior

Parameter	Symbol	Dimensions	Exponent	Group
			$-\frac{2}{3}$	F2, K5, N8
			$-\frac{1}{2}$	H2
			$-\frac{1}{3}$	S2, 3
			$+\frac{1}{2}$	E2
			$+\frac{2}{3}$	C9, J2, 3
			+1	B12, C3, 13, E3, 5, M1, O2, P8, 9, S4, 8, 15, T8
			+2	C1
			+4	C2
Viscosity (surface)	μ_S	M/θ	+1	S19
Yield stress	τ_y	$M/L\theta^2$	+1	B3, H6

LENGTHS, AREAS AND VOLUMES

Characteristic Linear Dimensions

(In all cases kinematic viscosity has been written as μ/ρ)

Parameter	Symbol	Dimensions	Exponent	Group
General characteristic linear dimension	Various	L	−5	P7
			−3	F9, L1
			−2	D9, 12, E3, F11, 12, H4, 5, N2, 3, 4, O1, R9, S8, 9, 15
			−1	B1, 10, E2, 5, 10, F1, 13, G4, H10, K6, L4, R6, 10, 15, 16, S6, 19, T5, W4
			$-\frac{1}{2}$	B11, D7, F14, O2
			$+\frac{1}{2}$	R4, T1, W2
			+1	B3, 4, 5, 7, 10, C7, D1, 3, 5, 11, 13, E7, 10, F1, 2, 5, G3, H2, K3, 4, 6, 10, L3, 4, 9, 11, M1, 3, 7, N6, 7, 8, O1, P1, 2, 11, R8, 10, 11, 16, S2, 7, 14, 16, 17, 18, T3, W1
			$+\frac{3}{2}$	D7, H7, T1
			+2	B9, D2, 4, E8, H6, K9, O1, P4, 5, 12, S8, 9, V1
			+3	A5, C10, G1, 5, K1, R5
			+4	T2
			+5	R6
Dimension of agitator, impeller, etc.	Various	L	−5	P7
			−3	F9
			−2	D7, H4
			+1	D11, F15
			+3	W3
Film thickness	L_f	L	+1	N8
Furnace half-width	L	L	−1	T7
Larmor radius	L_L	L	+1	L4
Mean free path	λ	L	+1	K6
Particle dimension	d_e	L	−2	S15
			+1	F2
			+3	A5, G1
Pore or nozzle radius	R	L	+1	M12, T7
Reactor length	L	L	+1	B7
			−1	C3, L9
Thickness of liquid layer	L	L	+1	H2, L11
			+2	L9
			+3	R5
			+4	T2

Areas

Parameter	Symbol	Dimensions	Exponent	Group
Area	A	L^2	−1	D9, F6, 7, 8
			+1	B2
Area/unit volume	S, A^*	$1/L$	−1	B6
			+1	M11, 12

Volumes

Parameter	Symbol	Dimensions	Exponent	Group
Volume	—	L^3	+	A5, H9, M11

TIMES AND FREQUENCIES

Parameter	Symbol	Dimensions	Exponent	Group
Time	θ	θ	−1	D8
			+1	D8, 12, E3, F11, 12, H1, 10, S15, T5
Frequency	f'	$1/\theta$	+1	H1, 10, S16, V1

TEMPERATURES AND CONCENTRATIONS (DRIVING FORCES)

Concentrations and Related Quantities

Parameter	Symbol	Dimensions	Exponent	Group
Dimensional concentration	C, c_A	M/L^3	−1	D1, 2, R2
			$-\frac{1}{2}$	T3
			+1	H10
Dimensionless concentration—e.g., wt./wt. inert material, etc.	n	—	−1	P6
			+1	A4, K8
Mass capacity	C_m	L^3/M	−1	R2
Mole fraction	Y, Z	—	±1	D14
Specific mass content, mass/unit mass	n^*	—	−1	K4
Surface concentration	Γ'	M/L^2	±1	S18
Vapor capacity (porous body)	C_b	$L\theta^2/M$	+1	B13, R2

Temperatures, Temperature Differences

Parameter	Symbol	Dimensions	Exponent	Group
Temperature, temperature difference	T, ΔT	T	−3	R1*, T6*
			−1	A4, 6*, B12, 13, C4*, 7, 10, D3*, 4*, 15, E1, G2, 6*, K3, 8, 9, 11, L9, N5, P5*, 12*, R14*, S6
			$-\frac{1}{2}$	L5
			$+\frac{1}{2}$	F6*, 7*, 8*
			+1	C4, G5, 6, J1, 4, L9, M1, P6, R5, 7, 14*
			+3	S14*
Rate of temperature change		T/θ	+1	P12

* Absolute temperature; others—temperature differences.

VELOCITIES, RATES, FLUXES, TRANSFER COEFFICIENTS

Velocities

Parameter	Symbol	Dimensions	Exponent	Group
Angular velocity (rate of rotation)	N	$1/\theta$	−3	P7
			−2	H4, L1
			−1	F9, R15
			$-\frac{1}{2}$	E2
			+1	S8, 11, 12, T1
			+2	F15, T2, W3
Fluid velocity	V	L/θ	−3	H5
			−2	C6, 11, D13, E9, 10, F1, M6, N2, 3, 4, R7, 8, 9, 10
			1	A2, B3, C12, 14, D1, 3, F10, H7, 8, K10, L3, M3, P4, S13, 16
			+1	A2, B6, 7, 11, C3, 12, 14, D5, 7, E5, 7, F10, 14, H10, K2, L5, 8, M2, 4, 7, P1, 2, 3, 10, R4, 11, 15, S1, 2, 3, T5, 6, V2, W2, 4,
			+2	B1, 12, C5, 11, D15, E1, 11, F13, H11, W1
			+3	C7
Impeller or agitator circumference	U_s	L/θ	−2	P14
			−1	D9
Light	V_l	L/θ	−1	L8
Sound	V_s	L/θ	−1	M2, N1, S1
Waves	V_w	L/θ	−1	V1
			−1	P3
Velocity gradient	dV/dL	$1/\theta$	−2	R12
Velocity of Alfven waves	V_A	L/θ	−1	A2, K2, M4
			+1	A2, N1
			+2	C11
Velocity of bearing surface	v_s	L/θ	+1	H8, O1, S9

Flow Rates (Mass Fluxes)

Parameter	Symbol	Dimensions	Exponent	Group
Mass flow rate (mass flux)	V_m	M/θ	−1	B2, M11, T7
			+1	F6, 7, 8, G4, T7
Mass flux density (mass flux/unit area)	G	$M/L^2\theta$	−1	J2, 3, P15, S13
			+1	K4, M11

TABLE A (Continued)

Flow Rates (Mass Fluxes)

Parameter	Symbol	Dimensions	Exponent	Group
Mass flux/unit volume (reaction rate)	U	$M/L^3\theta$	$+\frac{1}{2}$	T3
			$+1$	D1, 2, 3, 4
Reaction rate constant	K	L/θ	-1	S5
Volumetric flow rate	V_f	L^3/θ	-1	H9
			$-\frac{1}{2}$	D11
			$+\frac{1}{2}$	S11, 12
			$+1$	D9, F9

Heat Fluxes

Heat flux (heat flow/unit time)	q	ML^2/θ^3	$+1$	H5
Heat flux/unit area	q^*	M/θ^3	$+1$	K3, R6
Heat liberated/unit mass	Q	L^2/θ^2 (H/M)	$+1$	D3, 4
Rate of heat liberation/unit volume (heat source power)	j	$M/L\theta^3$	$+1$	P5

Transfer Coefficients

Heat transfer coefficient	h	$M/T\theta^3$	$+1$	B2, 4, C9, J2, N6, P15, S13
		$(H/L^2T\theta)$	$+4$	M1
Mass transfer coefficient	k_c	L/θ	$+1$	B5, J3, L9, N7, S5, 7

FORCE, HEAD, POWER, PRESSURE

Forces

Force (resistance)	F, F_R	ML/θ^2	$-\frac{1}{3}$	S2
			$+\frac{1}{3}$	K5
			$+1$	N2, 3, 4, R9
Force/unit length	F_b	M/θ^2	$+1$	H8, O1, S9

Heads, Power

Fluid head	H'	L	$-\frac{3}{4}$	S11
			$+1$	H4

Heads, Power

Parameter	Symbol	Dimensions	Exponent	Group
Head (energy per unit mass of fluid $= gH'$)	H	L^2/θ^2	-1	P3, T4
			$-\frac{3}{4}$	S12
			$+\frac{1}{4}$	D11
			$+1$	A6, P14, T4
Power	π	ML^2/θ^3 (LF/θ)	$+1$	L1, P7

Pressures

Pressure	P	$M/L\theta^2$	-1	F6, 7, 8, H9, S8, T8
			$+1$	B13, C6, L6, P13, R2
Pressure drop	$\Delta P, dP$	$M/L\theta$	$+1$	E9, 10, F1, H9, L3, R10
Pressure gradient	$\Delta P/L$	$M/L^2\theta^2$	$+1$	E10, F1, K1, P4, R10

CONSTANTS AND MISCELLANEOUS QUANTITIES

Gravity Acceleration

Gravity acceleration	—	L/θ^2	-2	A1
			-1	B1, F13, 15, M1, S6
			$-\frac{3}{4}$	S11
			$-\frac{1}{2}$	B11, F14, P13
			$-\frac{1}{3}$	C9, S3
			$+\frac{1}{3}$	F2, N8
			$+1$	A5, B9, C2, 10, D13, E8, G1, 5, H4, R5, 6, 8, 13

Other Quantities

Avogadro's number	N	$1/M$	$+1$	K9, S6
Boltzmann's constant	k	—	-1	K9. S6
Dufour coefficient	β	T	$+1$	A3, 4, F3
Energy of activation	E_a	L^2/θ^2	$+1$	A6
Gas constant	$\mathscr{R}$	$L^2/\theta^2 T$	-1	A6
			$-\frac{1}{2}$	L5
Shape factor	ξ^*	—	$+1$	V2
Soret coefficient	δ	$1/T$	$+1$	F3, P6
Stefan constant	η	$M/T^4\theta^3$	-1	R1, T6
			$+1$	S14

TABLE B
ALPHABETICAL LIST OF NAMED GROUPS

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
A1	Acceleration number	K_a	$F^3/\rho g^2\mu^3 = (N_{Re}N_{Fr1})^3/(H_a)^2$	Group dependent only on physical properties	Accelerated flow	25
A2	Alfven number	N_{Al}	V_A/V (or V/V_A) [cf. Cowling No., Kármán No. (2), magnetic mach number]	Ratio of Alfven wave velocity/fluid velocity	Magneto fluid dynamics	5, 6
A3	Anonymous group (1)	ϵ	$\beta^* c/r$ [see also Fedorov No. (2)]		Transfer processes	10
A4	Anonymous group (2)	Λ_1	$\beta^*\Delta n/\Delta t$, Δt = temp diff [T], Δn = conc diff [ ]		Transfer processes	67
A5	Archimedes number	N_{Ar}	$\frac{gL^3\rho_0}{\mu^2}(\rho-\rho_0)$; ρ_0 = fluid density, ρ = particle density (cf. N_{GaI})	N_{Re}, gravitational force/viscous force	Fluidization, motion of liquids due to density differences	6, 13
A6	Arrhenius group	—	E_0/RT	Activation energy/potential energy of fluid	Reaction rates	5
B1	Bagnold number	B	$3C_D\rho_g V^2/4d\rho_p g$, ρ_g = gas density, ρ_p = particle density	Drag force/gravitational force	Saltation studies	12
B2	Bansen number	N_{Ba}	h_rA_w/Wc_p, h_r = radiant heat transfer coefficient, A_w = wall area of channel, (cf. N_{St})	Heat transferred by radiation/thermal capacity of fluid	Radiation	1
B3	Bingham number	N_{Bm}	$\tau_y L/\mu_p V$ (L = channel width)	Ratio of yield stress/viscous stress	Flow of Bingham plastics	5
B4	Biot number (heat transfer)	N_{Bi}	hL_m/k (in French literature, "Biot No." = N_{Nu})	Midplane thermal internal resistance/surface film resistance	Unsteady state heat transfer	5, 6, 13
B5	Biot number (mass transfer)	N_{Bim}	k_cL/D_{int}, L = thickness of layer, D_{int} = diffusivity at interface	Mass transfer rate at interface/mass transfer rate in interior of solid wall thickness L	Mass transfer between fluid and solid	13
B6	Blake number	B	$V\rho/[\mu(1-\epsilon)S]$	Inertial force/viscous force	Beds of particles	6
B7	Bodenstein number	N_{Bo}	$VL/D_a = N_{Pe_m}$, L = reactor length, D_a = axial diffusivity (effective) (L^2/θ)		Diffusion in reactors	6
B8	Boltzmann number	N_{Bo}	= Thring radiation group			1
B9	Bond number	N_{Bo}	$(\rho-\rho')L^2g/\sigma = N_{We}/N_{Fr}$, if $\rho - \rho' \cong \rho$ (gas in liq.), ρ' = drop or bubble density, ρ = medium density	Gravitational force/surface tension force	Atomization, motion of bubbles and drops	5
B10	Bouguer number	N_{Bu}, B	$3C_D l_r/4\rho_D R$, C_D = wt dust/unit bed volume (M/L^3), l_r = mean path for radiation (L), ρ_D = dust density, R = mean particle radius. Also $N_{Bu} = kL$, L = characteristic dimension, k = absorption coefficient of medium		Radiant heat transfer to dust-gas streams	66
B11	Boussinesq number	B	$V/(2gR_H)^{1/2}$ (cf. N_{Fr})	(Inertia force/gravitational force)$^{1/2}$	Wave behavior in open channels	6
B12	Brinkman number	N_{Br}	$\mu V^2/k\Delta t$, Δt = temp diff	Heat generation/heat transferred	Viscous flow	6
B13	Bulygin number	N_{Bu}	$r\frac{C_v}{C_q}\frac{P}{t_m - t_0}$, t_m = temp. of medium, medium, t_0 = init. temp. of body	Heat for vaporization/heat to bring liquid to boiling point	Heat transfer during evaporation	6, 13, 14
C1	Capillary number	Ka	$\mu^4F/\rho\sigma^3 = (N_{We})^3/N_{Fr}(N_{Re})^4$	Depends only on physical properties	Action of surface tension in flowing media	25
C2	Capillarity-buoyancy number (physical properties group) (film No.)*	Ka_g, K_f	$g\mu^4/\rho\sigma^3 = Ka\,Kg = (N_{We})^3/(N_{Fr})(N_{Re})^4$	Depends only on physical properties and g	Effects of surface tension and acceleration in flowing media (two phase flow)	21, 25
C3	Capillary number	Ca	$\mu V/\sigma = N_{We}/N_{Re}$	Viscous force/surface tension force	Atomization, two phase flow	6
C4	Carnot number	Ca, N_{Ca}	$(T_2 - T_1)/T_2$, T_1, T_2 = abs temp of two heat sources or sinks	Theoretical efficiency of Carnot cycle operating between T_1 and T_2		21
C5	Cauchy number	N_C	$\rho V^2/E_s = (N_{Ho})^2$ = Hooke No.	Inertia force/compressibility force	Compressible flow	5, 25
C6	Cavitation number	σ_c	$[(p - P_v)/\rho]/(V^2/2)$, p = local static pressure (abs.), P_v = vapor pressure	Excess of local static head over vapor pressure head/velocity head	Cavitation	5
C7	Clausius number	Cl, N_{Cl}	$V^3L\rho/k\Delta T$, ΔT = temp diff		Heat conduction in forced flows	25
C8	Colburn number	—	Same as Schmidt number			5
C9	Condensation number (1)	N_{Co}	$(h/k)(\mu^2/\rho^2g)^{1/3}$	$N_{Co} = N_{Nu}\left[\frac{(\text{viscous force})}{(\text{gravity force})}\right] = \left[\frac{1}{K_f}\right]^{1/3}$	Condensation	5
C10	Condensation number (2)	N_{Cv}	$L^3\rho^2gr/k\mu\Delta t$; r = latent heat of condensation		Condensation on vertical walls	5
C11	Cowling number	C	$(V_A/V)^2$ = (Alfven number)^2		Magneto fluid dynamics	6
C12	Craya-Curtet number	C_t	$V_k/(V_d^2 - V_k^2/2)^{1/2}$, V_k = kinematic mean velocity, V_d = dynamic mean velocity		Radiant heat transfer	5, 27

---

* Very similar to Hu and Kintner's pH factor for drops and bubbles [A.I.Ch.E. J., 1, 42 (1955)]

TABLE B (Continued)

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
C13	Crispation group	N_{Cr}	$\mu\alpha/\sigma^* L$; σ^* = undisturbed surface tension; L = layer thickness		Convection currents	*55*
C14	Crocco number	N_{Cr}	$V/V_{\max} = \left[1 + \frac{2}{(\gamma-1)(N_{Ma})^2}\right]^{-1/2}$ $V_{\max}$ = maximum velocity of gas expanding adiabatically	Velocity/maximum velocity	Compressible flow	*5*
D1	Damköhler group I	DaI	UL/V_{cA}	Chemical reaction rate/bulk mass flow rate	Chemical reaction, momentum, and heat transfer	*5*
D2	Damköhler group II	DaII	UL^2/D_{cA}	Chemical reaction rate/molecular diffusion rate	Chemical reaction, momentum, and heat transfer	*5*
D3	Damköhler group III	DaIII	$QUL/C_p\rho Vt$	Heat liberated/bulk transport of heat	Chemical reaction, momentum, and heat transfer	*5*
D4	Damköhler group IV	DaIV	QUL^2/kt	Heat liberated/conductive heat transfer	Chemical reaction, momentum, and heat transfer	*5*
D5	Damköhler group V	DaV	$= (N_{Re})$			*5*
D6	Darcy number		$4f$; see Fanning friction factor			*5*
D7	Dean number	N_D	$(VL\rho/\mu)(L/2R)^{1/2}$; L = pipe diam.; R = radius of curvature of bend	N_{Re} (centrifugal force/inertial force)	Flow in curved channels	*5, 6*
D8	Deborah number	D	θ_r/θ_o; θ_o = observation time	Relaxation time/observation time	Rheology	*49*
D9	Delivery number	ϕ	V_f/Aw; A = impeller area = $\pi d^2/4 \equiv$ [Diameter No.]$^{-3}$ [Speed No.]$^{-1}$		Flow machines	*25*
D10	Deryagin number	De	$L(\rho g/2\sigma)^{1/2}$; L = film thickness	Film thickness/capillary length	Coating	*58*
D11	Diameter group	δ	$(\pi/4)^{1/2}(2H)^{1/4}\, d/(V_f)^{1/2}$, d = impeller diam. = [pressure No.]$^{1/4}$ × [delivery No.]$^{-1/2}$		Flow machines	*25*
D12	Diffusion group	β	$D\theta/L_m^2$; D = diffusivity of solute through stationary solution contained in solid; *cf.* N_{Fom}		Mass transfer	*37*
D13	Drag coefficient	$C_d = C_D$	$(\rho-\rho')L_g/\rho V^2$; ρ = density of object; ρ' = density of medium; *cf.* f, ψ, N_e	Gravity force/inertial force	Free settling velocities, etc.	*5*
D14	Drew number	N_D	$\frac{Z_A(M_A-M_B)+M_B}{(Z_A-Y_{AW})(M_B-M_A)} \ln \frac{M_V}{M_W}$: M_A, M_B = mol. wt. of components A and B; M_V, M_W = mol. wt. of mixture in vapor and at wall; Y_{AW} = mole fraction of A at wall; Z_A = mole fraction of A in diffusing stream		Boundary layer mass transfer rates; velocity profile distortion; drag coefficients for binary system	*22*
D15	Dulong number	Du, N_{Du}	$V^2/C_p\Delta T$ = Eckert No.			*25*
E1	Eckert number	N_E	$V_\infty^2/C_p\Delta T$, V_∞ = velocity of fluid far from body (=2/recovery factor, *q.v.* ≡ Dulong No.)		Compressible flow	*5, 24*
E2	Ekman number		$(\mu/2\rho\omega L^2)^{1/2} = (N_{Ro}/N_{Re})^{1/2}$	(Viscous force/Coriolis force)$^{1/2}$	Magneto-fluid dynamics	*6*
E3	Elasticity number (1)	N_{El_1}	$\theta_r\mu/\rho L^2$ = pipe radius	Elastic force/inertial force	Viscoelastic flow	*5*
E4	Elasticity number (2)	$\bar{K}_E$	$\rho C_p/\beta E \equiv$ [Gay Lussac No.] × [Hooke No.] ÷ [Dulong No.]	Depends on physical properties only	Effect of elasticity in flow processes	*25*
E5	Ellis number	N_{El}	$\mu_o V/2\tau_{1/2}R$; μ_0 = zero shear viscosity, $\tau_{1/2}$ = shear stress when $\mu = \mu_o/2[M/L\theta^2]$; R = tube radius		Flow of non-Newtonian liquids	*38*
E6	Elsasser number	N_{El}	$\rho/\mu\sigma_e\mu_e \equiv N_{Re}$/[magnetic Reynolds No.]		Magneto-fluid dynamics	*6*
E7	Entry Reynolds Number	K_E	$\chi/d_h . N_{Re} = \frac{\chi V\rho}{\mu}$; χ = entry length	As N_{Re}	Entry or inlet processes	*25*
E8	Eötvös number	N_{Eo}	$(\rho-\rho')L^2g/\sigma \equiv$ Bond No., *q.v.*			*6*
E9	Euler number (1)	N_{Eu_1}	$\Delta P_F/\rho V^2$; ΔP_F = pressure drop due to friction	Friction head/2 × velocity head	Fluid friction in conduits	*5, 13, 25*
E10	Euler number (2)	N_{Eu_2}	$d(-dp/dL)\rho V^2$; d = pipe diam., dp/dL = pressure gradient ≡ 2 × Fanning friction factor		Fluid friction in conduits	
E11	Evaporation number	K_r	V^2/r [r = heat of vaporization (L^2/θ^2)]		Evaporation processes	*25*
E12	Evaporation number (2)	$\bar{K}_r$	$C_p/r\beta$ (r as in **E11**) ≡ (Gay Lussac No.) × (**E11**)/(Dulong No.)		Evaporation processes	*25*
E13	Evaporation-elasticity number	$\bar{K}_{rE}$	$E/r\rho = K_r$/Hooke number		Evaporation processes	*25*
F1	Fanning friction factor	f	$d\Delta p_F/2pV^2L$, d = dimension of cross section; L = length (*cf.* resistance coeff., *Ne*)	Shear stress at wall expressed as number of velocity heads	Fluid friction in conduits	*5*
F2	Fedorov number (1)	F_{e_1}, N_{Fe_1}	$d\sqrt[3]{\frac{4g\rho^2}{3\mu^2}\left(\frac{\gamma M}{\gamma g}-1\right)}$ d_e = equiv. particle diam.; γM = sp. gr. of particles; γg = sp. gr. of gas (*cf.* N_{Ar})		Fluidized beds	*6, 13*

TABLE B (Continued)

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
F3	Fedorov number (2)	$F_{e_2} N_{Fe_2}$	$\delta\beta^* = K_1 Pn = \varepsilon \times K_o Pn$	Mass transfer analogy of Posnov number	Transport processes	*39, 67*
F4	Fenske number	N_F		Number of stages in separation process		*6*
F5	Fineness coefficient	ψ	$L/W_D^{1/3}$; W_D = volume displacement $[L^3]$		Ship modeling	*26, 43*
F6 **F7** **F8**	Fliegner numbers	$F(M_a)$ $f(M_a)$ $I(M_a)$	Functions of ratio of specific heats and mach number $V_m(cT)^{1/2}/A(p_s+\rho V^2) = [\gamma M_a/(\gamma-1)^{1/2}] \left[1+\frac{(\gamma-1)Ma^2}{2}\right]^{1/2}$ = impulse Fliegner number; γ = ratio of specific heats, Ma = mach number, A = flow area			*43*
F9	Flow coefficient	C_Q	V_f/Nd, d = impeller diam.		Power required by fans, etc.	*32*
F10	Fluidization number		V/V_{init}, V_{init} = velocity for initial fluidization	Fluid velocity in fluidized bed/that at start of fluidization	Fluidization	*59*
F11	Fourier number (heat transfer)	N_{Foh}	$k\theta/\rho C_p L_m^2$		Unsteady state heat transfer	*5, 13, 14, 25*
F12	Fourier number (mass transfer)	N_{Fom}	$D\theta/L^2 = k_c\theta/L$ (*cf.* **D12**)		Unsteady state mass transfer	*13*
F13	Froude number (1)	N_{Fr_1}	$V^2/gL \equiv (N_{Fr_2})^2$ (*cf.* Reech No., Boussinesq No., Vedernikov No.)	Inertial force/gravitational force	Wave and surface behavior	*5, 13, 25*
F14	Froude number (2)	N_{Fr_2}	$V/\sqrt{gL} \equiv (N_{Fr_1})^{1/2}$ (*cf.* Boussinesq No.)	Velocity of open channel flow/speed of very small gravity wave	Open channel flow; free surfaces	*7, 50*
F15	Froude No. (rotating)	Fr	DN^2/g; D = impeller diam.		Agitation	*64*
G1	Galileo number	N_{Ga_1}	$L^3 g\rho^2/\mu^2$ (*cf.* N_{Ar}, Nusselt thickness group)	$N_{Ga_1} = N_{Re} \times$ gravity force/viscous force	Circulation of viscous liquid, thermal expansion	*5, 13*
G2	Gay Lussac number	Ga, N_{Ga_2}	$1/\beta\Delta T$		Thermal expansion processes	*25*
G3	Goucher number	N_{Go}	$R(\rho g/2\sigma)^{1/2}$; R = wall or wire radius	Gravitational force/surface tension force$^{1/2}$	Coating	*24*
G4	Graetz (Grätz) number	N_{Gz}	$V_m c_p/kL$	Thermal capacity fluid/convective heat transfer	Streamline flow	*5, 25*
G5	Grashof number	N_{Gr}	$L^3\rho^2 g\beta\Delta t/\mu^2 \equiv N_{Ga_1}/N_{Ga_2} \equiv (N_{Re})^2/(N_{Ga_2})(N_{Fr_1})$	$N_{Gr} = N_{Re}$ (buoyancy force/viscous force)	Free convection	*5, 13, 25*
G6	Gukhman number	Gu, N_{Gu}	$(t_o - t_m)/T_o$; t_o, T_o = temp. (°C., °K.) of hot gas stream, t_m = temp. of moist surface (wet bulb temp.)	Thermodynamic criterion of evaporation under isobaric adiabatic conditions	Convective heat transfer in evaporation	*6, 23, 17, 53*
G7	Guldberg-Waage group	N_{Gw}	Given by equation relating volumes of reacting gases and reaction products		Chemical reaction in blast furnaces	*5*
H1	Hall coefficient	N_H	$f_c J$ (f_c = cyclotron frequency, J = av. free path/av. veloc.)		Magneto-fluid dynamics	*7*
H2	Hartmann number	M_H	$(\mu_e^2 H_e^2 \sigma_e L^2/\mu)^{1/2} \equiv (SR_M N_{Re})^{1/2} \equiv (N_{Re}N)^{1/2}$	Magnetically induced stress/hydrodynamic shear stress (magnetic body force/viscous force)$^{1/2}$	Magneto-fluid dynamics	*5, 6*
H3	Hatta number	β	$\gamma/\tanh\ \gamma$; $\gamma = (rCD)^{1/2}/k_c$, r = reaction rate constant $[L^3/M\theta]$ [a modified Hatta number has also been defined *35*)]		Gas absorption with chemical reaction	*41*
H4	Head coefficient	C_H	gH'/N^2d^2 (d = impeller diam.)		Flow in pumps and fans	*32*
H5	Heat transfer number	K_Q	$q/V^3L^2\rho$		Heat transfer in stream	*25*
H6	Hedstrom number	N_{He}	$\tau_y L^2\rho/\mu_p^2 \equiv (N_{Re}) \times (N_{Bm})$		Flow of Bingham plastics	*5*
H7	Helmholtz resonator group		$(d^3/W)^{1/2}/Ma$	Proportional to frequency × residence time	Pulsating combustion	*28*
H8	Hersey number		$F_b/\mu v_s$ (*cf.* truncation number)	Load force/viscous force	Lubrication	*6*
H9	Hodgson number	N_H	$Wf\Delta\rho_F/\bar{V}_{f.p_s}$	Time constant of system/period of pulsation	Pulsating gas flow	*5*
H10	Homochronous number	H_{o_1}	$V\theta/L$ (θ = time for liquid to move characteristic distance L)	Duration of process/time for liquid to move through L	Choice of time scales	*13*
H11	Hooke number	H_{o_2}	$\rho V^2/E \equiv$ Vauchy No., *q.v.*		Elasticity of flowing media	*25*
J1	Jakob modulus	Ja	$C_p\rho_L\Delta t/r\rho_v$ (ρ_L, ρ_v = densities of liquid and vapor; Δt = liquid superheat temperature diff.)	Maximum bubble radius/thickness of superheated film	Boiling	*6*
J2	*J*-factor (heat transfer)	j_H	$(h/c_pG)(c_p\mu/k)^{2/3} \equiv (N_{Nu})/(N_{Re})(N_{Pr})^{1/3}$		Heat, mass and momentum transfer theory	*5*
J3	*J*-factor (mass transfer)	j_M	$(k_c\rho/G)(\mu/\rho D)^{2/3} \equiv (k_c\rho/G)(N_{Sc})^{2/3}$			*5*
J4	Joule number	J	$2\rho C_p\Delta t/\mu_e H_e^2 \equiv 2(N_{Re})(R_M)/(M_H)^2(N_E)$	Joule heating energy/magnetic field energy	Magneto-fluid dynamics	*6*
K1	Kármán number (1)	N_K	$\rho d^3(-dp/dL)/\mu^2$ (d = pipe diam., dp/dL = pressure gradient) $\equiv 2(N_{Re})^2 f^{1/2}$		Fluid friction in conduits	*5*

TABLE B (Continued)

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
K2	Kármán number (2)	K	V/V_A (see Alfven No.)		Magneto-fluid dynamics	*6*
K3	Kirpichev number for heat transfer	K_{i_q}, N_{Ki_q}	$q^*L/k\Delta t$ (*cf.* N_{Bih}, N_{Nu})	Intensity external heat transfer/internal heat transfer intensity	Heat transfer	*6, 14*
K4	Kirpichev number for mass transfer	Ki_m	$GL/D\rho n^*$ (*cf.* N_{Pem}, N_{Bim})	Intensity external mass transfer/internal mass transfer intensity	Mass transfer	*13, 14*
K5	Kirpitcheff number		$(\rho F_R/\mu^2)^{1/3} = [(N_{Re})^2 cf]^{1/3}$		Flow around obstacles	*34*
K6	Knudsen number (1)	N_{Kn}	λ/L	Length of mean free path/characteristic dimension	Low pressure gas flow	*5*
K7	Knudsen number (2)	N_{KnA}	$\rho D/_{AB}D_{KA}\zeta$	Bulk diffusion/Knudsen diffusion	Gaseous diffusion in packed beds	*6*
K8	Kossovich number	K_o, N_{Ko}	$r_v\Delta n_m/c\Delta t$	Heat used for evaporation/heat used in raising temperature of body	Convective heat transfer during evaporation	*6, 14*
K9	Kronig number	Kr	$4L^2\beta\rho^2\Delta t E_S^2 N[\alpha + 2/3(p_e^2/kT)]/u^2 M$ E_S = electric field at surface, N = Avogadro's Number, α = polarization coefficient, p_e = molecular dipole moment, k = Boltzmann's constant, M = molecular weight	(N_{Re}) (electrostatic force/viscous force)	Convective heat transfer	*6, 44*
K10	Kutateladze number (1)	Ku	$IEL/\rho Vu'$; I = current density $[Q/L^2\theta]$, E = voltage $[ML/Q\theta^2]$, u' = enthalpy $[L^2/\theta^2]$		Electric arcs in gas streams	*65*
K11	Kutateladze number (2)	K	$r_v/c_p(t_e - t_w)$, (t_e, t_w = stream, wall temp.)		Combined heat and mass transfer in evaporation	*17*
L1	Lagrange group (1)	La_1	$\Pi/\mu L^3 N^2$; L = characteristic dimension of agitator $= N_{Re}.N_p$		Agitation	*6*
L2	Lagrange number (2)	La_2	$(D + \varepsilon_D)/D$	Combined molecular and eddy mass transfer rate/molecular mass transfer rate	Mass transfer in turbulent systems	*31*
L3	Lagrange number (3)	La_3	$\Delta PR/\mu V$		Magneto-fluid dynamics	*6*
L4	Larmor number	R_{La}	L_L/L; (L_L = Larmor radius)		Magneto-fluid dynamics	*23*
L5	Laval number	La	$V\Big/\left(\frac{2\gamma}{\gamma+1}RT\right)^{1/2}$; γ = ratio of specific heats	Linear velocity/critical velocity of sound	Compressible flow	*56*
L6	Leverett function	J	$(\zeta/e)^{1/2}(P\sigma/\sigma$	Characteristic dimension of surface curvature/characteristic dimension of pores	Two-phase flow in porous media	*6*
L7	Lewis No.	N_{Le}	$k/\rho c_p D = \alpha/D \equiv N_{Sc}/N_{Pr}$ (N.B.: Lewis number is sometimes defined as reciprocal of this quantity)		Combined heat and mass transfer	*5, 25*
L8	Lorentz number	N_{Lo}	V/V_1; (V_1 = velocity of light)	Fluid velocity/velocity of light	Magneto-fluid dynamics	*6*
L9	Luikov (Lўkov) number	Lu	$k_cL/\alpha = k_cL_\rho C_p/k$	Mass diffusivity/thermal diffusivity; rate of extension of mass transfer field/rate of extension of heat transfer field	Combined heat and transfer	*6, 13*
L10	Lukomskii number	Lu	α/a_m; a_m = potential conductivity of mass transfer $[L^2/\theta]$		Combined heat and mass transfer	*36*
L11	Lundquist number	N_{Lu}	$\sigma_e H_e \mu_e^{3/2} L/\rho^{1/2} = M_H(R_M/N_{Re})^{1/2}$ (L = thickness of fluid layer)		Magneto-fluid dynamics	*6*
L12	Lyashchenko number	Ly	$\equiv N_{Re}^3/N_{Ar}$		Fluidization	*19*
L13	Lykoudis number	N_{Ly}	$(\mu_e H_e)^2 \frac{\sigma_e}{\rho}\left[\frac{L}{g\beta\Delta t}\right]^{1/2} \equiv (M_H)^2/(N_{Gr})^{1/2}$	Magnetic body force/square root of product of the inertia and buoying force.	Magneto-fluid dynamics	*6*
M1	McAdams group		$h^4 L\mu\Delta t/k^3\rho^2 gr$	Constant for given surface orientation	Condensation	*5*
M2	Mach number	N_{Ma}, Ma	V/V_s; (V_s = velocity of sound in fluid) $\equiv v/\sqrt{E_b/\rho}$; (E_b = bulk modulus of fluid) (*cf.* Sarrau number)	Linear velocity/sonic velocity	Compressible flow	*5–7, 25, 50*
M3	Magnetic force parameter	N	$\mu_e^2 H_e^2 \sigma_e L/\rho V$	Magnetic body force/inertia force; resistance time of fluid in field/relaxation time of lines force	Magnetic-fluid dynamics	*6*
M4	Magnetic mach number	M_{Ma}	V/V_a (see Alfven number)		Magneto-fluid dynamics	*6*
M5	Magnetic Oseen number	k	$\frac{1}{2}(1 - N_{Al}^2)R_M$	Magnetic force/inertia force	Magneto-fluid dynamics	*2*
M6	Magnetic pressure number	S	$\mu_e H_e^2/\rho V^2$	Magnetic pressure/2 × dynamic pressure	Magneto-fluid dynamics	*5*
M7	Magnetic Reynolds number	R_M	$\sigma_c\mu_e LV$ (*cf.* velocity number)	Mass transport diffusivity/magnetic diffusivity	Magneto-fluid dynamics	*5*
M8	Maievskii number		$\equiv Ma$		Compressible flow	*12*
M9	Marangoni number	N_{Ma}	$\frac{\Delta\sigma}{\Delta t}\frac{\Delta t}{\Delta L}L^3/\mu\alpha$; L = layer thickness		Cellular convection	*46*

TABLE B (Continued)

Serial No	Name	Symbol	Definition	Significance	Field of Use	Reference
M10	Margoulis number	M	$\equiv N_{st}$		Forced convection	6, 7
M11	Merkel number	N_{Me}	$GA^{*}W^{*}/(V_m)$ gas	Mass of water transferred in cooling per unit humidity difference/mass of dry gas	Cooling towers, liquid-gas contact	5
M12	Miniovich number	Mn	SR/e; R = pore radius		Drying	36
M13	Mondt number	N_{Mo}		Convective/conductive heat transfer	Heat transfer	6
N1	Naze number	N_a	$V_A/V_s \equiv (N_{Ma}.N_{A1})$	Velocity Alfven wave/velocity of sound	Magneto-fluid dynamics	6
N2	Newton inertial force group	N_i	$F/\rho V^2 L^2$	Imposed force/inertial group	Agitation	5
N3	Newton number	N_e	$F_R/\rho V^2\ L^2$; (*cf.* f, ψ)	Resistance force/inertia force	Friction in fluid flow	25
N4	Number of velocity heads	N	$(F/\rho L^2)/(V^2/2)$	Imposed head/velocity head	Friction in conduits	6
N5	Number for similarity of phys. and chem. changes	K	$r/C_p\Delta t$	Heat flow for phase change/superheat (supercooling) of one of the phases	Changes of phase	14
N6	Nusselt number	N_{Nu}	$hL/k \equiv (N_{Re}N_{St})$ (*cf.* N_{Bi_h}, Ki_g)	Total heat transfer/conductive heat transfer	Forced convection	5, 13, 25
N7	Nusselt number for mass transfer	Nu_m, N_{Nu_m}	$k_cL/D = N_{Sh}$	Intensity of mass flux at interface/specific flux by pure molecular diffusion in layer of thickness, L	Mass transfer	13, 20
N8	Nusselt film thickness group	ψ, N_T	$L_f(\rho^2 g/\mu^2)^{1/3} \equiv (N_{Ga})^{1/3}$; ($L_f$ = film thickness)	$= (N_{Re})^{1/3}$ (gravitational force/viscous force)$^{1/3}$	Falling films	6
O1	Ocvirk number		$(F_b//\mu V_s)(a/R)^2(D/b)^2$; ($v_s$ = shaft surface velocity; R = shaft radius; D = shaft diam.) (*cf.* N_S)	Load force/viscous force	Lubrication	6
O2	Ohnesorge number	Z	$\mu/(\rho L\sigma)^{1/2} = (N_{We_1})^{1/2}/(N_{Re})$	Viscous force/(inertia force × surface tension force)$^{1/2}$	Atomization	5
P1	Péclet number (heat)	Pe, N_{Pe_h}	$LV\rho C_p/k = LV/\alpha = (N_{Re}.N_{Pr})$	Bulk heat transfer/conductive heat transfer	Forced convection	5, 13, 25
P2	Péclet number (mass)	N_{Pe_m}	$LV/D = (N_{Re}\ N_{Sc})$	Bulk mass transfer/diffusive mass transfer	Mass transfer	5
P3	Pipeline parameter	ρn	$V_W V_o/2H'_s$; (V_W = velocity water-hammer wave, V_o = initial velocity H'_s = static head × $g[L^2/\theta^2]$	Maximum pressure rise in water hammer/2 × static pressure	Water hammer	5
P4	Poiseuille number		$D^2(-dp/dL)/\mu V$(D = pipe diam., dp/dL = pressure gradient)	= 32 for laminar flow in round pipe	Laminar fluid friction	5
P5	Pomerantsev number	P_o	$jL^2/k(t_m - t_o)$(t_m, t_o = temp. of medium, initial temp. of body) *cf.* Damköhler Group IV)		Heat transfer with heat sources in medium	6, 14, 60
P6	Posnov number	Pn	$\delta\Delta t/(\Delta n_m)$(*cf.* Fe_2)		Combined heat and mass transfer	13, 14, 67
P7	Power number	N_P	$\Pi/L^5\rho N^3$	Drag on (agitator impeller) or inertial force	Power consumption by agitators, fans, pumps, etc	5, 32
P8	Prandtl number	N_{Pr}	$C_p\mu/k$ = Da IV/Da III × Da V	Momentum diffusivity/thermal diffusivity	Forced and free convection	5, 13, 25
P9	Prandtl number (mass transfer)	Pr_m	$\mu/\rho D = N_{Sc}$, v (used in Russian, German literature)	See Schmidt number		13
P10	Prandtl velocity ratio	u^+	$V/(r_W/\rho)^{1/2}$ (V = local fluid velocity)	Inertial force/wall shear force$^{1/2}$	Turbulence studies	5
P11	Prandtl dimensionless	y^+	$L(\rho r_W)^{1/2}/\mu$ (L = distance from wall, etc.)		Turbulence studies	
P12	Predvoditelev number	Pd	$\Gamma L^2/\alpha t_o = \left(\dfrac{dt^*}{\alpha(N_{Fo})}\right)_{\max}$ where t_o = init. temp. of body, t^* = temp. of medium relative to its initial temp.	Rate of change of temp. of medium/rate of change of temp. of body	Heat transfer	13, 14, 60
P13	Pressure number (1)	K_P	$P/\{g\sigma(\rho' - \rho'')\}^{1/2}$($\rho'$, ρ'' = density of liquid gas)	Absolute pressure in system (pressure jump on interface)		14
P14	Pressure number (2)		$H/\frac{1}{2}/_2U_s^2$(U_s = circumferential velocity) $\equiv$ [diameter No.]$^{-2}$ × [Speed No.]$^{-2}$		Flow machines (turbines, pumps, etc.)	25
P15	Psychrometric ratio		h_c/Gs	Heat transfer by convection/heat transfer by mass transfer	Wet and dry bulb thermometry	5
R1	Radiation number	K_r	$kE/\eta\sigma T^3 = (N_{We_1})$/(Hooke No.) × (Stefan No.)		Radiant transfer	25
R2	Ramzin number	Ra	$\dfrac{C_b P}{C_m(\Delta\Omega)} = \dfrac{\text{(Bulygin No.)}}{\text{(Kosovich No.)}}$		Molar mass transfer	40
R3	Ratio of specific heats	γ	C_p/C_v (specific heats at constant pressure, volume)		Compressible flow	5
R4	Rayleigh number (1)	N_{Ra_1}	$V(\rho L/\sigma)^{1/2} = N_{We_2}$ (*q.v.*)	See N_{We}	Breakup of liquid jets	5
R5	Rayleigh number (2)	R'_2	$L^3\rho^2 g\beta c_p\Delta t/\mu k = L^3\rho g\beta\Delta t/\mu\alpha = (N_{Gr})\cdot(N_{Pr})$		Free convection	5, 25

TABLE B (Continued)

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
R6	Rayleigh number (3)	Ra_3	$q^*L^5\rho^2 g\beta C_p/\mu k^2 x = (N_{Gr})(N_{Pr})(N_{Nu})(L/x)$; ($L$ = pipe diam.)		Combined free and forced convection in vertical tubes	*6*
R7	Recovery factor	N_{rf}	$C_p(t_{aw}-t_m)/V^2$; t_{aw} = attained adiabatic wall temp. t_m = temp. of moving medium (*cf.* Eckert No.)	Actual temp. recovery/theoretical temp. recovery	Convective heat transfer in compressible flow	*5*
R8	Reech number		$= 1/(N_{Fr_1})$ *q.v.*		Wave and surface behavior	*6*
R9	Resistance coefficient (1)	C_f	$F_R/\frac{1}{2}\rho V^2L^2$ (*cf.* drag coeff., Newton number, Fanning factor)		Flow resistance	*25*
R10	Resistance coefficient (2)	ψ	$\Delta p.\ D_H/\frac{1}{2}\rho V^2L$ (Δp = pressure drop over length, L) (*cf.* **R9**)		Fluid friction in conduits	*25*
R11	Reynolds number	N_{Re}	$LV\rho/\mu$	Inertia force/viscous force	Dynamic similarity	*5, 25*
R12	Reynolds number (rotating)	Re	$L^2N\rho/\mu$; L = impeller diam.		Agitation	*45*
R13	Richardson number	N_{Ri}	$-(g/\rho)(d\rho/dL)/(dV/dL)w^2$ [L = height of liquid layer, $(dV/dL)_w$ = velocity gradient at wall]	Gravity force/inertial force	Stratified flow of multilayer systems	*54*
R14	Romankov number	R'_o	T_D/T_{PROD}	Dry bulb temperature (abs.)/(product temperature (abs.)	Drying	*6, 52*
R15	Rossby number	N_{Ro}	$V/2\omega_e L\sin\Lambda$ (ω_e = angular velocity of earth's rotation [$1/\theta$]; Λ = angle between axis of earth's rotation and direction of fluid motion [$^-$])	Inertia force/Coriolis force	Effect of earth's rotation on flow in pipes	*5*
R16	Roughness factor		ε/L		Fluid friction	*5*
S1	Sarrau number		≡ mach number, *q.v.*		Compressible flow	*6*
S2	Schiller number (1)		$LV(\rho^2/\mu F_R)^{1/3}$		Flow around obstacles	*34*
S3	Schiller number (2)	Sch	$V\left[\frac{3}{4}\cdot\frac{\rho\gamma_m}{g\mu(\gamma_M-\gamma_m)}\right]^{1/3}$; V = velocity in fluidized bed; γ_m, γ_M = specific gravity of medium and material in bed		Fluidization	*66*
S4	Schmidt number	N_{Sc}	$\mu/\rho D$ (*cf.* N_{Pr_m}) (= Da II/Da I Da V)	Kinetic viscosity/molecular diffusivity	Diffusion in flowing	*5, 25*
S5	Semenov number	Sm	k_c/K; K = reaction rate constant [L/θ]		Reaction kinetics	*11*
S6	Senftleben number	S_e	$NE_s^2[\alpha+2/3(\rho_e^2/kT)]\cdot[1/4LM_g]$ Kronig number, *q.v.*		Convective heat transfer	*6*
S7	Sherwood number	N_{Sh}	$k_cL/D = Nu_m$ (also termed Taylor number)	Mass diffusivity/molecular diffusivity	Mass transfer	*5*
S8	Sommerfeld number (1)	N_{S_1}	$(\mu N/P_b)(D/a)^2$ (D = shaft diam., (*cf.*) Ocvirk number)	Viscous force/load force	Lubrication	*5*
S9	Sommerfeld number (2)	N_{S_2}	$(F_b/\mu V_s)(a/R)^2$ (V_s = veloc. of shaft surface; R = shaft radius) ($N_{S_2} = 4/\pi N_{S_1}$)	Viscous force/load force	Lubrication	*6*
S10	Spalding function	Sp	$-\left(\frac{\delta\theta}{\partial u^+}\right)_{u^+=0}$; $\theta = (T-T_\infty)/(T_w-T_\infty)$, T_w = wall temperature, T_∞ = free stream temp., u^+ = Prandtl velocity ratio	Dimensionless temp. gradient at wall	Convection	*18, 33*
S11	Specific speed	C_s	$N(V_f)^{1/2}/(gH')^{3/4}$ (H' = head of liquid produced by one stage) (*cf.* speed number)		Pumps and compressors	*8, 32*
S12	Speed number	σ	$(4\pi)^{1/2}(V_f)^{1/2}N/(2H)^{3/4}$ = (delivery number)$^{1/2}$ × pressure number)$^{-3/4}$ (*cf.* specific speed)		Flow machines	*25*
S13	Stanton number	N_{St}	$h/C_p\rho V = h/C_pG = (N_{Nu})/(N_{Re})(N_{Pr})$	Heat transferred/thermal capacity of fluid	Forced convection	*5, 6, 13, 25*
S14	Stefan number	St	$\eta LT^3/k$		Heat radiation	*25*
S15	Stokes number	St	$\mu\theta_v/\rho L^2$ (θ_v = vibration time) ≡ $(N_{S_1})^{-1}(N_{Re})^{-1}$		Particle dynamics	*6*
S16	Strouhal number	N_{S_1}, Sr	fL/V (*cf.* N_{Th})		Vortex streets; unsteady-state flow	*6, 25*
S17	Suratman number	Su	$\rho L\sigma/\mu^2 = (N_{Re})^2/(N_{We_1}) = (Z)^{-2}$		Particle dynamics	*6*
S18	Surface elasticity number	N_{El}	$-\frac{\Gamma'}{D_S}L\frac{(\partial\sigma)}{(\partial\Gamma')}$; Γ' = surface concentration of surfactant in undisturbed state, D_S = surface diffusivity, L = film thickness		Convection cells	*10*
S19	Surface viscosity number	N_{Vi}	$\mu_S/\mu L$; μ_S = surface viscosity, [M/θ], L = film thickness		Convection cells	*10*
T1	Taylor number (1)	N_{Ta_1}	$\omega_c(R_a)^{1/2}a^{3/2}\rho/\mu$; ($\omega_c$ = angular velocity of cylinder; R_a = mean radius of annulus)		Stability of flow pattern in annulus with rotating cylinder	*5*
T2	Taylor number (2)	N_{Ta_2}	$(2\omega L^2\rho/\mu)^2$[ω = rate of spin ($1/\theta$); L = height of fluid layer]	α(Coriolis force/viscous force)²	Effect of rotation on free convection	*6*
T3	Thiele modulus	m_T	$Q^{1/2}U^{1\cdot 2}L/k^{1/2}t^{1/2} = (\text{Da IV})^{1/2}$		Diffusion in porous catalysts	*5*
T4	Thoma number	σ_T	$(H_a-H_s-H_v)/H$ (H = total head; H_a = atm. pressure head; H_s = suction head; H_v = vapor pressure head)	Net positive suction head/total head	Cavitation in pumps	*5*
T5	Thomson number	N_{Th}	$\theta V/L$; θ = characteristic time (*cf.* N_{S_1})		Fluid flow	*6*
T6	Thring radiation group		$\rho C_pV/\epsilon^*\eta T^3$ (*cf.* Boltzmann number)	Bulk heat transport/heat transport by radiation	Radiation	*5*

TABLE B (Continued)

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
T7	Thring-Newby criterion	θ	$[(V_{m_1}+V_{m0})/V_{m0}](R/L)$; V_{m0}, V_{m_1} = mass flow rates of nozzle fluid and surrounding fluid $[M/\theta]$; R = equivalent nozzle radius; L = furnace half width		Combustion of fuels	*4*
T8	Truncation number	r	$\mu\gamma/P$ (*cf.* Hersey number)	Shear stress/normal stress	Viscous flow	*6*
V1	Valensi number	V	$\omega L^2\rho/\mu$; ω = circular oscillation frequency when $\mu = 0$ $[1/\theta]$		Oscillations of drops and bubble-	*57*
V2	Vedernikov number	V	$\zeta^*\xi^*\bar{V}/(V_w-\bar{V}) \equiv \zeta^*\xi^*(N_{Fr_2})$ (ζ^* = exponent of hydraulic radius in formula $[^-]$; ζ^* = shape factor of channel section; V_w = absolute velocity of disturbance wave)	Generalized Froude number	Instability of open-channel flow	*6, 61*
V3	Velocity number	R_v	$\equiv$ Magnetic Reynolds number, *q.v.*			*5, 6*
W1	Weber number (1)	N_{We_1}	$V^2\rho L/\sigma = (N_{We_2})^2$	Inertia force/surface tension force	Bubble formation, etc.	*2, 25*
W2	Weber number (2)	N_{We_2}	$V(\rho L/\sigma)^{1/2} = (N_{We_1})^{1/2}$			
W3	Weber number (rotating)	W_e	$L^3N^2\rho/\sigma$; L = impeller diameter		Agitation	*64*
W4	Weissenberg number	N_{We}	$\omega_3 V/\omega_1 L$; $\omega_3 = \int_0^\infty sG(s)\,ds$, $\omega_1 = \int_0^\infty G(s)\,ds$, G = relaxation modulus of linear viscoelasticity, s = recoverable elastic strain	Viscoelastic force/viscous force	Viscoelastic flow	*63*

TABLE II. ALPHABETICAL LIST OF NEW GROUPS

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
A0	Absorption No.	*Ab*	$kc_L\sqrt{\frac{xL_f}{DV'_f}}$ kc_L = liquid side mass transfer coefficient; x = length of wetted surface; L_f = film thickness; V'_f = volume flow rate per wetted perimeter $[L^2/\theta]$	Dimensionless mass transfer coefficient	Gas absorption in wetted wall column	*40*
A1a	Advance ratio	*J*	V/ND V = forward speed; D = propeller diameter	Special form of Strouhal No.	Propeller studies	*27*
A1b	Aeroelasticity parameter	—	≡ Cauchy No., *q.v.*	Inertia force/compressibility force	Compressible flow	*27*
A4a	Anonymous group 3	ε	Dx/V'_fL_f (symbols as in Absorption No.). $\varepsilon = (Ab)^2/(N_{Sh})^2$	Dimensionless diffusivity	Gas absorption in wetted wall column	*40*
A4b	Anonymous group 4	$1/\alpha$ $(1/\beta)$	$\tau_w R/V_\infty\mu$; R = cylinder radius; V_∞ = velocity outside boundary layer	Frictional force/viscous force dimensionless skin friction)	Laminar boundary layer flow	*12, 28, 35*
B1a	Bairstow No.	—	$V/V_{s.w}$ $V_{s\,w}$ = velocity of sound at wall (*cf.* Mach. No.)	Previously used for Mach No., now largely obsolete	—	*27*
B2a	Batchelor No.	—	$VL\sigma_e/V_l^2\varepsilon_e$ ε_e = electrical permittivity $[Q^2\theta^2/L^3M]$	—	Magnetofluid dynamics	*27*
B13a	Buoyancy parameter	—	$\frac{\Delta T}{T}\frac{gL}{V^2} = (N_{Gr})/(N_{Re})^2 = \frac{\Delta T}{T}\left(\frac{1}{N_{Fr_1}}\right)$	Buoyancy force/inertia force	Free convection	*27*
D6a	Darcy No. (2)	Da_2	VL/D'; D' = permeability coefficient of porous medium $[L^2/\theta]$	Inertia force/permeation force	Flow in porous media	*19*
D8a	Generalized Deborah No.	N_2	$\sqrt{I_e - I_w}\cdot\theta_n$ I_e = invariant of rate of strain tensor (sec.$^{-2}$); I_w = invariant of vorticity tensor (sec.$^{-2}$); θ_n = natural time (sec.)	Generalization of group **D8**	Rheology	*2*
D14a	Dufour No.	Du_2	$\mathcal{R}\Theta n'_{10}/c_p$ Θ = thermodiffusion constant $= (D_T/D)/n_{10}n_{20}$ $[-]$; D_T = thermal diffusion coefficient $[L^2/\theta]$; $n'_{10}, n'_{20} = n'_1/n', n'_2/n'$; n' = total No. of molecules $= n'_1 + n'_2$; n'_1, n'_2 = No. of molecules of components 1, 2, in binary mixture; also $Du_2 = (D_T/D)p/\rho c_p T n_{20}$	Heat of isothermal mass transfer/enthalpy of unit mass of mixture	Thermodiffusion	*22*
E1a	Einstein No.	—	V/V_l (V_l = speed of light) (*cf.* Lorentz No.)	Fluid velocity/velocity of light	Magnetofluid dynamics	*27*
E4a	Electric field parameter	R_E	$E/V\mu_e H_e$		Magnetohydrodynamics	*26*
E4b	Electrical characteristic No.	*El*	$\rho(d\chi/dT)L^2\cdot\Delta T\cdot E_1^2/\mu^2$ E_1 = electrical field strength $[ML/Q\theta^2]$; χ = dielectric susceptibility $[Q^2\theta^2/ML^3]$		Electrical effects on transfer processes	*6*
E4c	Electrical Nusselt No.	N_e	VL/D^*; $D^* = \frac{1}{2}(D^+ + D^-)$ $[L^2/\theta]$ D^+, D^- = diffusion coefficients of ions (*cf.* group *P2*)	Convection current/diffusion current	Electrochemistry	*10*
E4d	Electrical Reynolds No. (1)	—	$\varepsilon_e V/Q'Lb'$ ε_e = electrical permittivity $[Q^2\theta^2/L^3M]$; Q' = space charge density $[Q/L^3]$; b' = carrier mobility $[Q\theta/M]$		Electrical effects in flow	*27*
E4e	Electrical Reynolds No. (2)	—	Alternate name for group **E4c**, *q.v.*			*10*
E10a	Modified Euler No.	*Eu'*	$H_{L'}\rho_L g/V_G^2\rho_G$ H'_L = head of liquid on tray $[L]$; ρ_L, ρ_G = densities of liquid, vapor; V_G = vapor velocity based on free area, $[L/\theta]$	Friction head/velocity head	Flow of vapor across mass transfer trays	*13*
E13a	Expansion No.	*Ex*	$\left(\frac{gd}{V^2}\right)\left(\frac{\rho_L - \rho_G}{\rho_L}\right)$ d = bubble diam., V = bubble veloc., ρ_L, ρ_G = densities of liquid, gas	$1/N_{Fr_1}$ × density ratio	Rise of bubbles	*13*
F12a	Fourier No. (flow)	*Fo*	$\mu\theta/\rho L^2$		Unsteady state flow problems	*17*
F12b	Frank-Kamenetskii No.	δ	$\frac{Q''}{k}\frac{E_a}{\mathcal{R}T_a^2}L^2k_a\exp(-E_a/\mathcal{R}T)$ Q'' = heat liberated per unit mass of material reacting/unit volume $[1/L\theta^2]$; k = thermal conductivity of reacting mixture $[ML/T\theta^3]$; k_a = preexponential constant in Arrhenius equation $[M/\theta]$	Dimensionless heat effect of reaction	Heat transfer in reacting systems	*24*
F12c	Frequency parameter	—	$\omega'L/V = 2\pi$ × Strouhal No.; $2\pi/\omega'$ = period of motion $[\theta]$	Special form of Strouhal No. (*cf.* also **T5**)	Unsteady state flow, etc.	*27*
F12d	Frequency No. (2)	N_f	$\omega_r L/V$; L = packing element diameter $[L]$; V = interstitial fluid velocity $[L/\theta]$; ω_r = radial frequency (radians/sec.) $[1/\theta]$ (*cf.* groups **H10**, **S16**, **T5**)	Special form of group **F12c**	Flow in packed or fluidized beds	*23, 29*

TABLE II. ALPHABETICAL LIST OF NEW GROUPS (Continued)

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
F12e	Frössling No. (heat transfer)	Fs_h	$(N_{Nu} - 2)/(N_{Re}^{1/2} N_{Pr}^{1/3})$	Special dimensionless heat transfer coefficient	Heat transfer to spheres in turbulent streams	*8a*
F12f	Frössling No. (mass transfer)	Fs_m	$(N_{Sh} - 2)/(N_{Re}^{1/2} N_{Sc}^{1/3})$	Special dimensionless mass transfer coefficient	Mass transfer to spheres in turbulent streams	*8a*
G2a	Geometric No.	Ge	h^*/H^*; h^* = surface area of packing element/perimeter $[L]$; H = height of packing $[L]$.	Dimensionless packed bed height	Mass transfer in packed beds	*5a*
G2b	Goertler parameter	—	$\frac{VL_b\rho}{\mu}\left(\frac{L_b}{R_c}\right)^{1/2}$ L_b = boundary layer momentum thickness, $[L]$; R_c = radius of curvature $[L]$	Modified Reynolds No.	Boundary layer flow on curved surfaces	*27*
G5a	Diffusional Grashof No.	Gr_{AB}	$L^3\rho^2 g\beta'_A \Delta n'_A/\mu^2$ n'_A = mass fraction of species A, $[-]$; β'_A = coefficient of density change with n'_A, $[-]$	Buoyant forces × inertia forces/(viscous forces)^2	Interphase transfer by free convection (density changes caused by concentration differences)	*37*
H8a	Hess No.	Ge	$(KL^2/a_m)(C_o)^{n-1}$ n = order of reaction $[-]$; C_o = initial concn. $[M/L^3]$; a_m = mass transfer conductivity of reaction products $[L^2/\theta]$; K = reaction rate constant, $\left[\frac{1}{\theta}\frac{L^{3n-3}}{M^{n-1}}\right]$		Heat and mass transfer with chemical and phase changes	*22*
H9a	Homochronicity No.	Ho_3	$N\theta$ (N = mixer r.p.m., θ = mixing time)		Mixing, agitation	*31*
H11a	Hydraulic resistance group	Γc	$\Delta p_p/\rho_L gL = We_4 \times$ Laplace No. $= N_{Eu_1} \times N_{Fr_1}$ Δp_p = pressure drop across liquid on tray $[M/L\theta^2]$; ρ_L = liquid density; L = depth of liquid on tray	Characterizes development of interfacial area per unit area of tray	Pressure drop in distillation columns	*15*
I1	Ilyushin No.	I	$(Vd\rho/\mu) \,.\, 4\tau_D/3V^2\rho = 4\tau_D/3V^2\rho \,.\, N_{Re}$; τ_D = max. dynamic slip resistance $[M/L\theta^2]$		Flow of viscoplastic fluids	*20a*
K7a	Knudsen No. for diffusion	$N_{Kn_{A1}}$	$3eD_{AB}/4\zeta K_{oA}\bar{u}_A$ K_{oA} = Knudsen flow permeability constant; $\bar{u}_A$ = equilibrium mean molecular speed of species A	Differs from **K7** by numerical constant	Gaseous diffusion in packed beds	*34*
K7b	Kondrat'ev No.	Kn	ΨN_{Bih}; N_{Bih} = heat transfer Biot No.; Ψ = temp. field nonuniformity parameter = $(t_s - t_a)/(\bar{t} - t_a)$; t_a = temp. of surrounding medium; t_s = body surface temp.; $\bar{t}$ = body mean temp.		Heat transfer between fluid and body	*21*
L3a	Laplace No.	La_4	$\Delta p_p \,.\, L/\sigma = \Gamma c/We_4$ Δp_p = pressure drop across liquid on tray $[M/L\theta^2]$; L = depth of liquid on tray		Interfacial behavior on distillation trays	*32*
L5a	Lebedev No.	Le_2	$eb_T(t_a - t_o)/c_b p\rho_s$ b_T = intensity of vapor expansion in capillaries of body on heating $[M/L^3T]$; t_a = temp. of surrounding medium; t_o = initial temp.; ρ_s = density of solid $[M/L^3]$	Molar expansion flux/molar vapor transfer flux	Drying of porous materials	*22*
L5b	Leroux No.	—	≡ cavitation No. **C6**			*27*
L7a	Turbulent Lewis No.	Le_T	$c_p\rho\varepsilon_D/k_T = l_D/l_T = \varepsilon_D/\varepsilon_T$ k_T = eddy thermal conductivity $[LM/T\theta^3]$; l_D, l_T = mixing lengths for mass, heat transfer $[L]$; ε_T = eddy thermal diffusivity $[L^2/\theta]$		Combined turbulent heat and mass transfer	*11*
L7b	Lewis-Semenov No.	—	$\equiv 1/N_{Le}$; N_{Le} = group **L7**			*27*
L7c	Lock No.	—	$\rho R^4 ia'/I$ ρ = fluid density; a' = rotor lift curve slope $[L^2/M]$; i = blade chord $[L]$; R = rotor radius $[L]$; I = moment of inertia of blade about hinge $[L^4]$		Rotor blade dynamics	*27*
M3a	Magnetic Grashof No.	—	$4\pi\sigma_e\mu_e(\mu/\rho) \,.\, N_{Gr}$ N_{Gr} = group **G5**		Magnetofluid dynamics	*7*
M4a	Magnetic No.	R_m	$\mu_e H_e(\sigma_e L/\rho V)^{1/2}$ = (magnetic force parameter)$^{1/2}$	See group **M3**	Magnetohydrodynamics	*26*
M5a	Magnetic Prandtl No.	—	$\sigma_e\mu_e\frac{\mu}{\rho}$ *cf.* Magnetic Grashof No., group **M3a**	Magnetic Reynolds No./Reynolds No. (properties of fluid)	Magnetofluid dynamics	*27*
P3a	Plasticity No.	P	≡ Bingham No.			*41*
P7a	Modified Power No.	N'_p	$\frac{\Pi}{L^3\rho N^3}\left(\frac{D'_e}{L'}\right)\frac{(\Delta\omega)^{-1/2}}{(N_b N_e)^{0.67}}$ D'_e = effective agitator diameter $[L]$; L'_e = effective agitator height; $\Delta\omega$ = wall proximity factor; N_b = No. of blades on agitator; N_e = effective No. of blade edges		Agitation	*36*
P8a	Total Prandtl No.	**Pr**	$\frac{\varepsilon_M + (\mu/\rho)}{\varepsilon_T + \alpha}$ $\varepsilon_M, \varepsilon_T$ = eddy transfer coefficient for momentum, heat $[L^2/\theta]$	Total momentum diffusivity/total thermal diffusivity	Heat transfer in combined turbulent and laminar flows	*25*
P8b	Turbulent Prandtl No.	Pr_T	$\varepsilon_M/\varepsilon_T = l/l_T$ $\varepsilon_M, \varepsilon_T$ = eddy viscosity, eddy thermal diffusivity $[L^2/\theta]$; l, l_T = mixing lengths for momentum, heat transfer	Eddy momentum diffusivity/eddy thermal diffusivity	Heat transfer in turbulent flow	*9, 25*

TABLE II. ALPHABETICAL LIST OF NEW GROUPS (Continued)

Serial No.	Name	Symbol	Definition	Significance	Field of Use	Reference
P12a	Predvoditelev No. (mass transfer)	Pd_m	$(\Gamma_m L^2/a_m)\,(N_{Fo_m})$ Γ_m = rate of change of mass transfer potential of medium, (mass/unit mass)/time $[1/\theta]$; a_m = mass conductivity of material $[L^2/\theta]$; N_{Fo_m} = group **F12**	Rate of change of concn. of medium/rate of change of concn. of body	Mass transfer	*22*
P15a	Pulsation No.	N_{Pu}	$fd_e\rho/G$ d_e = equiv. diam. of channel		Transfer to pulsed fluid	*20*
R0a	Radial frequency parameter (1)	—	$\omega_r D/V^2,\ \omega_r\alpha/V^2$ D = diffusivity or dispersion coefficient of packed bed $[L^2/\theta]$, ω_r = radial frequency (radians/sec.) $[1/\theta]$		Packed and fluidized beds	*18, 33, 39*
R0b	Radial frequency parameter (2)	—	$\omega_r L^2/\alpha$ ω_r as in group **R0a**; L = tube radius $[L]$		Packed and fluidized beds	*29, 39*
R0c	Radial frequency parameter (3)	—	$\omega_r^2 DL/V^3$ (Quantities as in groups **R0a** and **R0b**)	$\dfrac{(\text{Group }\mathbf{R0a})^2}{(\text{Group }\mathbf{P2})}$	Packed and fluidized beds	*18, 33, 39*
R0d	Radial frequency parameter (4)	—	$L(\omega_r/2D)^{1/2} \equiv [\tfrac{1}{2}(\text{group }\mathbf{R0b})^{1/2}$ (quantities as in groups **R0a** and **R0b**)	Analog of Wave No.	Packed and fluidized beds	*39*
R1a	Radiation parameter	Φ	$e^+\eta T_w^3 d_h/k$ e^+ = function of mean surface emissivity of walls, $[-]$; T_w = wall temp. (abs.) $[T]$		Effect of radiation on convective mass transfer	*14*
R6a	Reaction enthalpy No.	N_H	$(\Delta u)_A(\Delta n_A)/C_p(\Delta T)$ $(\Delta u)_A$ = enthalpy of reaction per unit mass of A produced $[L^2/\theta^2]$, n_A = mass fraction of species A $[-]$	Change in reaction energy/change in sensible energy	Interphase transfer with chemical reaction	*37*
R15a	Rossby No.	—	$V/\omega L$	More general form of group **R15**		*27*
S4a	Schmidt No. (2)	—	$\equiv$ Semenov No. (2)	No longer used		*27*
S4b	Schmidt No. (3)	$(Sc)_3$	$\mu\chi/\rho\sigma_e L^2$ χ as in group **E4b**	Diffusivity of vorticity/mass diffusivity of ions	Electrochemistry	*10*
S4c	Total Schmidt No.	**Sc**	$\dfrac{\varepsilon_M+(\mu/\rho)}{\varepsilon_D+D}$ ε_M = eddy viscosity $[L^2/\theta]$	Total momentum diffusivity/total mass diffusivity	Mass transfer in combined laminar and turbulent flows	*25*
S4d	Turbulent Schmidt No.	Sc_T	$\varepsilon_M/\varepsilon D = l/l_D$ ε_M = eddy viscosity, $[L^2/\theta]$, l, l_D = mixing lengths for momentum, mass transfer $[L]$	Eddy momentum diffusivity/eddy mass diffusivity	Mass transfer in turbulent flow	*25*
S5a	Semenov No. (2)	—	$\equiv 1/N_{Le}$ (see group **L7**)			*27*
S7a	Smoluchowski No.	—	$L/\lambda \equiv 1/N_{Kn}$ N_{Kn} = group **K6**	See group **K6**		*27*
S9a	Soret No.	S_o	$\Theta n'_{20}$ (definitions as group **D14a**)	Dimensionless thermodiffusion coefficient	Coupled heat and mass transfer	*22*
S10a	Spalding No.	B'	$c_p\Delta T/(r_v - q_r/V_m)$; q_r = radiant heat flux $[ML^2/\theta^3]$; V_m = rate of mass transfer $[M/\theta]$	Ratio (sensible heat/latent heat) for evaporated material	Droplet evaporation	*33a*
S13a	Stark No.	Sk	$\eta T^3 L/k$ L = thickness of layer $[L]$; ($\equiv$ Stefan No.)		Radiant heat transfer	*1, 30*
S14a	Stewart No.	—	$\mu_e^2 H_e^2 \sigma_e L/V\rho$	(Hartmann No.)^2/Reynolds No.	Magnetofluid dynamics	*38*
S15a	Stokes No. (2)	St_2	$1.042\ m_f g\rho(1-\rho/\rho_f)R^{*3}/\mu^2$; ρ, μ = density, viscosity of fluid; m_f, ρ_f = mass, density of float; R^* = tube radius/float radius $[-]$		Calibration of rotameters	*10a*
S18a	Surface tension No.	T_S	$\mu^2/h^*\sigma\rho$; h^* = surface area of packing element/perimeter $[L]$		Mass transfer in packed columns	*5a*
T5a	Thompson No.	N_{Th_2}	$\dfrac{-\Delta t}{\Delta L}L^2\left(\dfrac{d\sigma}{dT}\right)/\mu\alpha$ (*cf.* Marangoni No.)		Cellular convection	*3*
T7a	Thrust coefficient	T_c	$F_T/\rho V^2 d^2$ F_T = thrust force $[ML/\theta^2]$; V = forward speed $[L/\theta]$; d = tip diameter $[L]$		Propeller studies	*27*
T7b	Torque coefficient	Q_c	$F'/\rho V^2 d^3$ F' = propeller torque $[ML^2/\theta^2]$		Propeller studies	*27*
T7c	Transiency groups	K_p K_Q	$\dfrac{1}{\left(\dfrac{\partial p}{\partial L}\right)}\cdot\dfrac{\partial\left(\dfrac{\partial p}{\partial L}\right)}{\partial(Fo_f)}$ $\dfrac{1}{(N_{Re})}\cdot\dfrac{\partial(N_{Re})}{\partial(Fo_f)}$ $\partial p/\partial L$ = pressure gradient in flow direction $[M/L^2\theta^2]$; Fo_f = group **F12a**		Transient flow behavior	*17*
W0a	Wave No.	**k**	$L(\omega_r/2\alpha)^{1/2}$ w_r = radial frequency (radians/sec.) $[1/\theta]$	Heat transfer analog group **R0d**	Cyclic heat transfer	*4*
W3a	Weber No. (3)	We_3	$\sigma/\rho_L g L^2$ ρ_L = liquid density $[M/L^3]$; L = depth of liquid on tray $[L]$	Surface tension force/gravity force	Interfacial area determination in distillation equipment	*32*
W4a	Generalized Weissenberg No.	N_1	$\sqrt{I_e}\,\theta_n$ (definitions as group **D8a**)	Generalization of group **W4**	Rheology	*2*

TABLE III. TABLES FOR IDENTIFYING DIMENSIONLESS GROUPS

These tables incorporate those from the earlier publication (*5*)

Basic dimensions are taken to be: *Length* [L]
Mass [M]
Electrical charge [Q]
Temperature [T]
Time [θ]

PHYSICAL PROPERTIES

General Physical Properties

Parameter	Symbol	Dimensions	Exponent	Groups
Coefficient of thermal bulk expansion	β	$1/T$	-1	E4, E12, G2
			$+1$	G5, K9, M3a, R5, R6
Coefficient of density change with concn. n_A	$\beta_{A'}$	—	$+1$	G5a
Density	ρ	M/L^3	-2	M1
			-1	A1, B1, B10, C1, C2, C6, D3, D13, D14a, E3, E9, E10, E10a, E13, E13a, F1, F11, F12a, H5, H11a, I1, J1, K4, K10, L5a, L5b, L7, M3, M3a, M5a, M6, N2, N3, N4, P7, P8a, P9, R0a, R9, R10, R13, S4, S4b, S4c, S13, S14a, S15, S15a, S18a, T7a, T7b, T7c, W3a
			$-\frac{2}{3}$	C9, J3
			$-\frac{1}{2}$	E2, L11, M4a, O2, P13
			$+\frac{1}{3}$	J3, K5, S3
			$+\frac{1}{2}$	D10, G3, P10, P11, R4, W0a, W2
			$+\frac{2}{3}$	F2, N8, S2
			$+1$	A1b, B1, B6, B9, C5, C7, D5, D7, D13, E4, E4b, E6, E7, E8, E10a, E13a, G2b, H6, H11, I1, J1, J3, J4, K1, L7a, L7b, L7c, L9, M3a, P1, P8a, P15a, R0b, R5, R11, R13, S4a, S5a, S15a, S17, T1, T5a, T6, T7c, V1, W1, W3
			$+2$	A5, C10, G1, G5, G5a, K9, R5, R6, S15a, T2
Density gradient	$d\rho/dL$	M/L^4	$+1$	R13
Diffusivity (molecular unless noted otherwise)	D, a_m	L^2/θ	-1	B5, B7[4], D2, D14a, E4c, E4e, H8a[1], K4[1], K7[2], L2, L7, L10, N7, P2, P9, P12a[1], S4, S4c, S9a
			$-\frac{2}{3}$	J3
			$-\frac{1}{2}$	A0, R0d
			$+1$	A4a, F12[1], K7[3], K7a, L2[4], L7b, L9[1], R0a, R0c, S4a, S5a
Diffusivity (eddy)	E_D, ε_D	L^2/θ	-1	S4c, S4d
			$+1$	L2, L7a
Diffusivity (surface)	D_S	ML/θ^2	-1	S18
Diffusion tortuosity	ζ	—	-1	K7, K7a
Dispersion (permeability) coefficient	D'	L^2/θ	-1	D6a
			$+1$	R0a, R0c
Molecular weight	M	M	-1	D14, K9, S6
			$+1$	D14
Permeability (packed bed)	ξ	L^2	$+\frac{1}{2}$	L6
Porosity (voidage)	e	—	-1	B6, M12
			$-\frac{1}{2}$	L6
			$+1$	K7, K7a, L5a
Specific gravity	γ	—	$\pm\frac{1}{3}$	F2
Surface tension	σ	M/θ^2	-3	C2
			-2	C1
			-1	B9, C3, C13, E8, L3a, L6, R1, S18a, W1, W3
			$-\frac{1}{2}$	D10, G3, O2, P13, R4, W2
			$+1$	M9, S17, S18, T5a, W3a

PHYSICAL PROPERTIES

General Physical Properties

Parameter	Symbol	Dimensions	Exponent	Groups
Thermal diffusion coefficient	D_T	L^2/θ	$+1$	D14a, S9a

[1] Coefficient of potential diffusion in mass transfer.
[2] Knudsen diffusion coefficient.
[3] Binary bulk diffusion coefficient.
[4] Effective diffusivity (molecular and eddy) $= D + \varepsilon_D$.

Electrical and Magnetic Properties

Carrier susceptibility	b'	$Q\theta/M$	-1	E4d
Current density	I	$Q/L^2\theta$	$+1$	K10
Dielectric susceptibility	χ	$Q^2\theta^2/L^3M$	$+1$	E4b, S4b
Electrical conductivity	σ_e	$Q^2\theta/L^3M$	-1	E6, S4b
			$+\frac{1}{2}$	H2, M4a
			$+1$	B2a, L11, M3, M3a, M5a, M7, S14a
Electrical permittivity	ε_e	$Q^2\theta^2/L^3\theta$	-1	B2a
			$+1$	E4d
Field strength	H_e	$Q/L\theta$	-2	J4
			-1	E4a
			$+1$	H2, L11, M4a
			$+2$	K9, M3, M6, S6, S14a
Magnetic permeability	μ_e	ML/Q^2	-1	E4a, E6, J4
			$+1$	H2, M3a, M4a, M5a, M6, M7
			$+\frac{3}{2}$	L11
			$+2$	M3, S14a
Space charge density	Q	Q/L^3	-1	E4d
Voltage	E	ML/θ^2Q	$+1$	E4a, K10
			$+2$	E4b

Thermal Properties

Eddy thermal conductivity	k_T	$ML/T\theta^3$	-1	L7a
Eddy thermal diffusivity	ε_T	L^2/θ	-1	L7a, P8a, P8b
Humid heat	s	L^2/θ^2T	-1	P15
Latent heats of phase change	λ, r	L^2/θ^2	-1	A3, E11, E12, E13, J1, M1, S10a
			$+1$	B13, C10, K8, K11, N5
Ratio of specific heats	γ	—	$\pm\frac{1}{2}$	L5
Specific heat	C, c_p	L^2/θ^2T	-1	B2, B13, D3, D14a, D15, E1, F11, J2, K8, K11, L7, M10, N5, R0a, R3, R6a, S13
			$-\frac{1}{3}$	J2
			$+\frac{1}{2}$	F6, F7, F8, W0a
			$+\frac{2}{3}$	J2
			$+1$	A3, E4, E12, G4, J1, J4, L7a, L7b, L9, P1, P8, P8a, R0b, R3, R5, R6, R7, S5a, S10a, T5a
Surface emissivity	e^*	—	-1	T6
			$+1$	R1a
Temperature conductivity (thermal diffusivity)	$\alpha = \dfrac{k}{\rho c_p}$	L^2/θ	-1	L7b, L9, P1, P8a, P12, R0b, R5, S5a, T5a
			$-\frac{1}{2}$	W0a
			$+1$	C13, L7, L10, R0a
Thermal conductivity	k, λ	$ML/T\theta^3$	-3	M1
			-2	R6
			-1	B4, B12, C7, C9, C10, D4, F12b, G4, K3, K7b, L7b, L9, N6, P1, P5,

TABLE III. TABLES FOR IDENTIFYING DIMENSIONLESS GROUPS (Continued)

Thermal Properties

Parameter	Symbol	Dimensions	Exponent	Groups
				P8, R0b, R1a, R5, S4a, S5a, S13a, S14, T5a
			$-\frac{2}{3}$	J2
			$-\frac{1}{2}$	T3, W0a
			+1	F11, L7, R0a, R1

Rheological and Elastic Behavior

Parameter	Symbol	Dimensions	Exponent	Groups
Eddy viscosity	e_M	L^2/θ	+1	P8a, P8b, S4c, S4d
Invariants of rate-of-strain and vorticity tensors	I_e, I_w	θ^{-2}	$+\frac{1}{2}$	D8a, W4a
Maximum dynamic slip resistance	τ_D	$M/L\theta^2$	+1	I1
Modulus of elasticity	E	$M/L\theta^2$	−1	A1b, C5, E4, H11
			+1	C1, E13, R1
			+3	A1
Rate of shear	$\dot{\gamma}$	$1/\theta$	+1	T8
Rigidity coefficient	μ_p	$M/L\theta$	−2	H6
			−1	B3, P3a
Shear stress	τ	$M/L\theta^2$	−1	E5
			$-\frac{1}{2}$	P10
			$+\frac{1}{2}$	P11
			+1	A4b
Viscosity (in all cases, kinematic viscosity has been written as μ/ρ)	μ	$M/L\theta$	−2	A1, A5, E4b, G1, G5, G5a, K1, K9, S15a, S17, T2
			−1	A4b, B6, C10, D5, D7, E6, E7, G2b, H8, I1, L1, L3, M3a, O1, P4, P11, R5, R6, R11, S9, S19, T1, T5a, T7c, V1
			$-\frac{2}{3}$	F2, K5, N8
			$-\frac{1}{2}$	H2
			$-\frac{1}{3}$	S2, S3
			$+\frac{1}{2}$	E2
			$+\frac{2}{3}$	C9, J2, J3
			+1	B12, C3, C13, E3, E5, F12a, M1, M3a, M5a, O2, P8, P8a, P9, S4, S4b, S4c, S8, S15, T7c, T8
			+2	C1, S18a
			+4	C2
Viscosity (surface)	μ_s	M/θ	+1	S19
Yield stress	τ_y	$M/L\theta^2$	+1	B3, H6, P3a

LENGTHS, AREAS, AND VOLUMES

Characteristic Lengths

Parameter	Symbol	Dimensions	Exponent	Groups
General length dimension	Various	L	−5	P7, P7a
			−3	F9, L1, S15a, T7b
			−2	D9, D12, E3, F11, F12, F12a, H4, H5, N2, N3, N4, O1, R9, S4b, S8, S9, S15, T7a, W3a
			−1	A1a, B1, B10, E2, E4d, E5, E10, F1, F13, G2a, G4, H10, H11a, K6, L4, P7a, R6, R10, R15, R15a, R16, S6, S7a, S18a, S19, T5, T5a, T7, T7c, W4
			$-\frac{1}{2}$	B11, D7, F14, G2b, O2
			$+\frac{1}{2}$	A0, G2b, M4a, R4, T1, W2
			+1	A4a, A4b, B2a, B3, B4, B5, B7, B10, B13a, C7, D1, D3, D5, D6a, D11, D13, E4c, E4e, E7, E10, E13a, F1, F2, F5, F12c, F12d, F15, G2a, G2b, G3, H2, I1, K3, K4, K6, K7b, K10, L3, L3a, L4, L7c, L9, L11, M1, M3, M7, N6, N7, N8, P1, P2, P3a, P7a, P11, P15a, R0c, R0d, R1a, R8, R10, R11, R16, S2, S7, S7a, S13a, S14, S14a, S16, S17, S18, T3, T7c, W0a, W1
			$+\frac{3}{2}$	D7, H7, T1
			+2	B9, D2, D4, E4b, E8, F12b, H6, H8a, K9, O1, P4, P5, P12, P12a, R0b, S8, S9, T5a, T7c, V1
			+3	A5, C10, G1, G5, G5a, K1, M3a, R5, S15a, W3
			+4	L7c, T2
			+5	R6
Dimension of agitator, propeller, etc.	Various	L	−5	P7, P7a
			−3	F9, T7b
			−2	H4, T7a
			−1	A1a, P7a
			+1	D11, F15, L7c, P7a
			+3	W3
			+4	L7c
Film thickness	L_f	L	−1	A4a
			+1	N8
Furnace half-width	L	L	−1	T7
Larmor radius	L_L	L	+1	L4
Mean free path	λ	L	−1	S7a
			+1	K6
Mixing length-mass	l_D	L	−1	S4d
			+1	L7a
Mixing length-heat	l_T	L	−1	L7a, P8b
Mixing length-momentum	l	L	+1	P8b, S4d
Particle dimension	d_e	L	−2	S15
			+1	F2, F12d
			+3	A5, G1
Pore or nozzle radius	R	L	+1	B7
Thickness of liquid layer	L	L	−1	C13, M9, T5a
			+1	H2, L11
			+2	M9, T5a
			+3	R5
			+4	T2

Areas

Parameter	Symbol	Dimensions	Exponent	Groups
Area	A	L^2	−1	D9, F6, F7, F8
			+1	B2
Area/unit volume	S, A^*	L^{-1}	−1	B6
			+1	M11, M12

Volumes

Parameter	Symbol	Dimensions	Exponent	Groups
Volume	W, W^*	L^3	+1	A5, H9, M11

TIMES AND FREQUENCIES

Parameter	Symbol	Dimensions	Exponent	Groups
Time	θ	θ	−1	D8, T7c
			+1	D8, D8a, D12, E3, F11, F12, F12a, H1, H9a, H10, P12a, S15, T5, W4a
Frequency	f', ω'	$1/\theta$	+1	F12c, H1, P15a, S16, V1
Radial frequency[1] (= $2\pi f'$)	ω_r (radians/time)	$1/\theta$	$+\frac{1}{2}$	R0d, W0a
[1] Also see angular velocity.			+1	F12d, R0a, R0b
			+2	R0c

TEMPERATURES AND CONCENTRATIONS (DRIVING FORCES)

Concentrations and Related Quantities

Parameter	Symbol	Dimensions	Exponent	Groups
Dimensional concentration	C, c_A	M/L^3	$(n-1)$	H8a (nth order reaction)
			−1	D1, D2, R2
			+1	B10
Dimensionless concentration (e.g., wt./wt., mass fraction)	n	—	−1	D14a, P6, S9a
			+1	A4, D14a, G5a, K8, R6a, S9a

TABLE III. TABLES FOR IDENTIFYING DIMENSIONLESS GROUPS (Continued)

Concentrations and Related Quantities

Parameter	Symbol	Dimensions	Exponent	Groups
Mole fraction	Y, Z	—	±1	**D14**
Rate of change of mass transfer potential (mass per unit mass/time)	Γ_m	$1/\theta$	+1	**P12a**
Specific mass content (mass/unit mass)	n^*	—	−1	**K4**
Surface concentration	Γ'	M/L^2	±1	**S18**
{Vapor capacity Mass capacity} (porous body)	c_b	$L\theta^2/M$	−1	**L5a**
			+1	**B13, R2**
Vapor expansion intensity on heating	b_T	M/L^3T	+1	**L5a**

Temperatures, Temperature Differences

Parameter	Symbol	Dimensions	Exponent	Groups
Dimensional temperature, temperature difference	$T, \Delta T$	T	−3	**R1*, T6***
			−2	**F12b***
			−1	**A4, A6*, B12, B13, B13a*, C4*, C7, C10, D3*, D4*, D14a*, D15. E1, E4b*, F12b*, G2, G6*, K3, K7b, K8, K9, K11, N5, P5*, P12*, R6a, R14*, S6, T5a**

VELOCITIES, RATES, FLUXES, TRANSFER COEFFICIENTS

Velocities

Parameter	Symbol	Dimensions	Exponent	Groups
Angular velocity (rate of rotation) (see also frequency)	N, ω	$1/\theta$	−3	**P7, P7a**
			−2	**H4, L1**
			−1	**A1a, F9, R15, R15a**
			$-\frac{1}{2}$	**E2**
			+1	**H9a, S8, S11, S12, T1**
			+2	**F15, T2, W3**
Equilibrium molecular speed of *A*	u_A	L/θ	−1	**K7a**
General velocity (usually of fluid)	V	L/θ	−3	**H5, R0c**
			−2	**B13a, C6, C11, D13, E9, E10, E13a, F1, I1, L5b, M6, N2, N3, N4, R0a, R7, R8, R9, R10, T7a, T7b**
			−1	**A2, A4b, B3, C12, C14, D1, D3, E4a, F10, F12c, F12d, H7, H8, I1, K10, L3, M3, P3a, P4, S13, S14a, S16, T7c, V2**
			$-\frac{1}{2}$	**M4a**
			+1	**A1a, A2, B1a, B2a, B6, B7, B11, C3, C12, C14, D5, D6a, D7, E1a, E4c, E4d, E4e, E5, E7, F10, F14, G2b, H7, H10, I1, K2, L5, L8, M2, M4, M7, P1, P2, P3, P10, R4. R11. R15. R15a. S1, S2, S3, T5, T6, T7c, V2, W2, W4**
			+2	**A1b, B1, B12, C5, C11, D15, E1, E11, F13, H11, P3, W1**
Velocity of impeller or agitator periphery	U_s	L/θ	−2	**P14**
			−1	**D9**
Velocity of light	V_l	L/θ	−2	**B2a**
			−1	**E1a, L8**
Velocity of sound	V_s	L/θ	−1	**B1a, M2, N1, S1**
Velocity of waves	V_w	L/θ	−1	**V2**
			+1	**P3**
Velocity of Alfven waves	V_A	L/θ	−1	**A2, K2, M4**
			+1	**A2, N1**
			+2	**C11**
Velocity of bearing surface	v_s	L/θ	−1	**H8, O1, S9**
Velocity gradient	dV/dL	$1/\theta$	−2	**R13**

Flow Rates, Mass Fluxes, etc.

Parameter	Symbol	Dimensions	Exponent	Groups
Mass flow rate (mass flux)	V_m	M/θ	−1	**B2, M11, T7**
			+1	**F6, F7, F8, G4, S10a, T7**
Mass flow rate/unit area (mass flux density)	G	$M/L^2\theta$	−1	**J2, J3, P15, P15a, S13**
			+1	**K4, M11**
Mass flux/unit volume (reaction rate)	U	$M/L^2\theta$	$+\frac{1}{2}$	**T3**
			+1	**D1, D2, D3, D4**
Reaction rate constant (first order)	K	L/θ	−1	**S5**
Reaction rate constant (*n*th order	K_n	$\frac{1}{\theta} \cdot \frac{L^{3n-3}}{M^{n-1}}$	+1	**H8a**
Volumetric flow rate	V_f	L^3/θ	−1	**H9**
			$-\frac{1}{2}$	**D11**
			$+\frac{1}{2}$	**S11, S12**
			+1	**D9, F9**
Volumetric flow rate/wetted perimeter	$V_{f'}$	L^2/θ	−1	**A4a**
			$-\frac{1}{2}$	**A0**

Heat Fluxes and Related Quantities

Parameter	Symbol	Dimensions	Exponent	Groups
Heat flux (heat flow/unit time)	q	ML^2/θ^3	−1	**S10a**
			+1	**H5**
Heat flux/unit area	q^*	M/θ^2	+1	**K3, R6**
Heat of reaction/unit mass of material reacting	Δu	L^2/θ^2	+1	**R6a**
Heat liberated/unit mass	Q	L^2/θ^2	+1	**D3, D4**
Heat liberated per unit mass of material reacting/unit volume	Q''	$1/L\theta^2$	+1	**F12b**
Heat liberated/unit volume (heat source power)	j	$M/L\theta^3$	+1	**P5**

Transfer Coefficients

Parameter	Symbol	Dimensions	Exponent	Groups
Heat transfer coefficient	h	$M/T\theta^3$	+1	**B2, B4, C9, J2, K7b, N6, P15, S13**
			+4	**M1**
Mass transfer coefficient	k_c	L/θ	+1	**A0, B5, J3, L9, N7, S5, S7**

FORCE, TORQUE, POWER, PRESSURE, HEAD

Force, Torque, Power

Parameter	Symbol	Dimensions	Exponent	Groups
Force	F, F_R	ML/θ^2	$-\frac{1}{3}$	**S2**
			$+\frac{1}{3}$	**K5**
			+1	**N2, N3, N4, R9, T7a**
Force/unit length	F_b	M/θ^2	+1	**H8, O1, S9**
Torque	F	ML^2/θ^2	+1	**T7b**
Power	Π	ML^2/θ^3	+1	**L1, P7, P7a**

TABLE III. TABLES FOR IDENTIFYING DIMENSIONLESS GROUPS (Continued)

Head, Pressure

Parameter	Symbol	Dimensions	Exponent	Groups
Fluid head (ft. fluid)	H'	L	$-\frac{3}{4}$	**S12**
			$+1$	**E10a, H4**
Head (energy/unit mass of fluid = gH')	H	L^2/θ^2	-1	**P3, T4**
			$-\frac{3}{4}$	**S11**
			$+\frac{1}{4}$	**D11**
			$+1$	**P14, T4**
Pressure	P, p	$M/L\theta^2$	-1	**F6, F7, F8, H9, L5a, S8, T8**
			$+1$	**B13, C6, D14a, L5b, L6, P13, R2**
Pressure drop	$\Delta P, dP$	$M/L\theta^2$	$+1$	**E9, E10, F1, H9, H11a, K1, L3, L3a, R10**
Pressure gradient	$\Delta P/L$	$M/L^2\theta^2$	-1	**T7c**
			$+1$	**E10, F1, H11a, K1, P4, R10, T7ć**

CONSTANTS AND MISCELLANEOUS QUANTITIES

Gravity Acceleration

Gravity acceleration	g	L/θ^2	-2	**A1**
			-1	**B1, F13, F15, H11a, M1, S6, W3a**
			$-\frac{3}{4}$	**S11**
			$-\frac{1}{2}$	**B11, F14, P13**
			$-\frac{1}{3}$	**C9, S3**
			$+\frac{1}{3}$	**F2, N8**
			$+1$	**A5, B9, B13a, C2, C10, D13, E8, E10a, E13a, G1, G5, G5a, H4, M3a, R5, R6, R8, R13, S15a**

Other Quantities

Parameter	Symbol	Dimensions	Exponent	Groups
Arrhenius pre-exponential factor	k_0	M/θ	$+1$	**F12b**
Avogadro's No.	N	$1/M$	$+1$	**K9, S6**
Boltzmann's constant	k	$ML^2/\theta^2 T$	-1	**K9, S6**
Dufour coefficient	β^*	T	$+1$	**A3, A4, F3**
Energy of activation/unit mass	E_a	L^2/θ^2	$+1$	**A6, F12b**
Gas constant/unit mass	$\mathscr{R}$	$L^2/\theta^2 T$	-1	**A6, F12b**
			$-\frac{1}{2}$	**L5**
			$+1$	**D14a**
Knudsen flow permeability	K_{oA}	L	-1	**K7a**
Mass of float	m_f	M	$+1$	**S15a**
Moment of inertia	I	L^4	-1	**L7c**
Rotor lift curve slope	a'	L^2/M	$+1$	**L7c**
Shape factor	ξ^*	—	$+1$	**V2**
Soret coefficient	δ	$1/T$	$+1$	**F3, P6**
Stefan-Boltzmann coefficient (radiation coefficient)	η	$M/T^4\theta^3$	$+1$	**R1, T6**
			$+1$	**R1a, S13a, S14**
Thermodiffusion constant	Θ	—	$+1$	**D14a, S9a**

NUMERICAL DATA PROJECTS

SOURCES OF CRITICAL DATA

The following is abstracted from *Continuing Numerical Data Projects, A Survey and Analysis*. This publication was prepared under the auspices of the Office of Critical Tables, National Academy of Sciences and National Research Council. Persons requesting further information and details regarding the projects listed may obtain the publication from Printing and Publishing Office, National Academy of Sciences, 2101 Constitution Avenue, Washington, D. C., 20418. Price $5.00.

THERMODYNAMIC PROJECTS

Selected Values of Chemical Thermodynamic Properties, NBS Circular 500, F. D. Rossini, D. D. Wagman, W. H. Evans, S. Levine, and I. Jaffe, Government Printing Office, Washington, D.C. 20402, 1952, iv + 1268 pp, $7.25 (out of print). Paperback reprint issued in two parts: I. Tables; and II. References; Government Printing Office, Washington, D.C. 20402, 1961 (out of print). Revisions of C500 are being issued provisionally as NBS Technical Notes, listed below.

Selected Values of Chemical Thermodynamic Properties

Part 1: Tables for the First Twenty-three Elements in the Standard Order of Arrangement, NBS Technical Note 270-1, D. D. Wagman, W. H. Evans, I. Halow, V. B. Parker, S. M. Bailey, and R. H. Schumm, U.S. Government Printing Office, Washington, D.C. 20402, October 1965, iv + 124 pp, $0.65.

Part 2: Tables for the Elements Twenty-four through Thirty-two in the Standard Order of Arrangement, NBS Technical Note 270–2, D. D. Wagman, W. H. Evans, I. Halow, V. B. Parker, S. M. Bailey, and R. H. Schumm, U.S. Government Printing Office, Washington, D.C. 20402, May 1966, iv + 62 pp, $0.40.

Selected Values of Properties of Hydrocarbons and Related Compounds, American Petroleum Institute Research Project 44, J. B. Zwolinski, dir., Texas A&M Research Foundation, College Station, Texas. As of June 1966 there were 2391 valid data sheets, complete set 6 volumes at $0.30 per sheet.

Selected Values of Properties of Chemical Compounds, Thermodynamics Research Center, B. J. Zwolinski, dir., Texas A&M Research Foundation, College Station, Texas. As of June 1966 there were 754 valid data sheets, complete set 2 volumes at $0.30 per sheet.

JANAF (Joint Army-Navy-Air Force) Thermochemical Tables, PB 168 370, D. R. Stull, dir., Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg., 1965, 945 pp, $10.00.

First Addendum, PB 168 370–1, D. R. Stull, dir., Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg., 1966, vii + 197 pp, $4.00 (Supplements 18, 19, 20, and 21).

Information on further supplements is available from Dr. D. R. Stull, dir., Thermal Research Laboratory, Dow Chemical Company, Midland, Michigan.

Contributions to the Data on Theoretical Metallurgy, I–XV, published as Bureau of Mines bulletins between 1932 and 1962. Many bulletins were superceded; six are revisions and Bulletin 601 is a reprinting of four previous bulletins and out of print for some years, but still in demand as essential in present-day research. The ones currently available are listed below.

Contributions to the Data on Theoretical Metallurgy

XIII High-Temperature Heat-Content, Heat Capacity, and Entropy Data for the Elements and Inorganic Compounds, K. K. Kelley, Bulletin 584 (Bureau of Mines), U.S. Government Printing Office, Washington, D.C. 20402, 1960, 232 pp, $1.25.

XIV Entropies of Elements and Inorganic Compounds, K. K. Kelley and E. G. King, Bulletin 592 (Bureau of Mines), U.S. Government Printing Office, Washington, D.C. 20402, 1961, 149 pp, $0.75.

XV A Reprint of Bulletins 383, 384, 393, and 406 (III, IV, V, and VII), Bulletin 601, Bureau of Mines (Publications Distribution Section, 4800 Forbes Avenue), Pittsburgh, Penna., 1962, 525 pp, single copies free.

383: The Free Energies of Vaporization and Vapor Pressures of Inorganic Substances, K. K. Kelley, 1935.

384: Metal Carbonates, Correlation and Applications of Thermodynamic Data, K. K. Kelley and C. T. Anderson, 1935.

393: Heats of Fusion of Inorganic Substances, K. K. Kelley, 1936.

406: The Thermodynamic Properties of Sulphur and Its Inorganic Compounds, K. K. Kelley, 1937.

Thermodynamic Properties of Chemical Substances, V. P. Glushko et al, eds, Vol. I, 1164 pp, and Vol. II, 916 pp, USSR Academy of Sciences, Moscow, 1962, approx $16.00.

Thermodynamic Constants of Substances, Handbook in 10 parts, V. P. Glushko, ed, USSR Academy of Sciences, All-Union Institute of Scientific and Technological Information, Moscow: Part I, 1965, 146 pp, 72 kopecks ($1.75); Part II, 1966, 96 pp, 52 kopecks ($1.40). Available in the United States from Victor Kamkin, Inc., Bookstore, 1410 Columbia Rd. N.W., Washington, D.C. 20009.

Chemical Thermodynamics in Non-Ferrous Metallurgy, J. I. Gerassimov, A. N. Krestovnikov, and A. S. Shakhov, Metallurgical Publishing House, Moscow.

Vol. I: Theoretical Introduction, Thermodynamic Properties of Important Gases, Thermodynamics of Zinc and Its Important Compounds, 1960, 231 pp.

THERMODYNAMIC PROJECTS (Continued)

Vol. II: Thermodynamics of Copper, Lead, Tin, Silver, and Their Important Compounds, 1960, 231 pp.

Vol. III: Thermodynamics of Tungsten, Molybdenum, Titanium, Zirconium, Niobium, Tantalum, and Their Important Compounds, 1963, 283 pp. English translation available as NASA-TT-F-285 or CFSTI-TT-65-50111, $6.00, from the Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg. 22151.

Vol. IV: Thermodynamics of Aluminum, Antimony, Magnesium, Nickel, Bismuth, Cadmium, and Their Important Compounds, 1966, 428 pp.

Selected Values for the Thermodynamic Properties of Metals and Alloys, Ralph Hultgren, Raymond L. Orr, Philip D. Anderson, and Kenneth K. Kelley, John Wiley & Sons, Inc., New York, N.Y. 10016, 1963, xi + 963 pp, $12.50.

Thermochemistry for Steelmaking, Vol. I, J. F. Elliott and M. Gleiser, Addison-Wesley Publishing Co., Reading, Mass. 01867, 1960, viii + 296 pp, $17.50.

Thermochemistry for Steelmaking, Vol. II: Thermodynamics and Transport Properties, J. F. Elliott, M. Gleiser, and V. Ramakrishna, Addison-Wesley Publishing Co., Reading, Mass. 01867, 1963, xvi + 550 pp (pp 297–846), $25.00.

Thermodynamic Functions of Gases, F. Din, ed, Butterworth & Co. (Publishers) Ltd., 88 Kingsway, London, W.C.2, England, $12.50 per volume.

Vol. 1: Ammonia, Carbon Dioxide, Carbon Monoxide, 1956, viii + 175 pp.

Vol. 2: Air, Acetylene, Ethylene, Propane and Argon, 1956, vi + 201 pp.

Vol. 3: Methane, Nitrogen, Ethane, 1961, vi + 218 pp.

THERMOPHYSICAL PROJECTS

A Compendium of the Properties of Materials at Low Temperatures, V. J. Johnson, ed. Available from Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg. 22151.

Phase I, Part I, Properties of Fluids, July 1960, 489 pp, WADD Technical Report 60-56, Part I (PB-171-618), $6.00.

Phase I, Part II, Properties of Solids, Oct. 1960, 330 pp, WADD Technical Report 60-56, Part II (PB-171-619), $4.00.

Phase I, Part III, Bibliography of References (cross-indexed), Oct. 1960, 161 pp, WADD Technical Report 60-56, Part III (PB-171-620), $3.00.

Phase II, R. B. Stewart and V. J. Johnson, eds, Dec. 1961, 501 pp, WADD Technical Report 60-56, Part IV (AD-272-769), $8.10.

Thermophysical Properties Research Center Data Book. Issued as loose-leaf sheets; sold on subscription basis at $0.10 per sheet, Thermophysical Properties Research Center, Purdue University, Research Park, 2595 Yeager Rd., West Lafayette, Ind. 47906.

Vol. I: Metallic Elements and Their Alloys.

Vol. II: Nonmetallic Elements, Compounds and Mixtures (In Liquid and Gaseous States at Normal Temperature and Pressure).

Vol. III: Nonmetallic Elements, Compounds and Mixtures (In the Solid State at Normal Temperature and Pressure).

Handbook of Thermophysical Properties of Solid Materials, A. Goldsmith, T. E. Waterman, and H. J. Hirschorn, revised edition, 1961 (8½″ × 11¼″), The Macmillan Co., 60 Fifth Ave., New York, N.Y. 10011, $90.00 per set.

Vol. I: Elements, vi + 752 pp.

Vol. II: Alloys, vi + 1,270 pp.

Vol. III: Ceramics, vi + 1,162 pp.

Vol. IV: Cermets, Intermetallics, Polymerics and Composites, vi + 798 pp.

Vol. V: Appendix (includes materials, author indexes, and a list of references), 286 pp.

PHYSICOCHEMICAL PROJECTS

Tables of Chemical Kinetics, Homogeneous Reactions, NBS Circular 510, U.S. Government Printing Office, Washington, D.C. 20402, 1951, xxiv + 732 pp (out of print).

Tables of Chemical Kinetics, Homogeneous Reactions, NBS Circular 510, Supplement 1, U.S. Government Printing Office, Washington, D.C. 20402, 1956, xiv + 422 pp (out of print).

Alphabetical Index to Tables of Chemical Kinetics, Homogeneous Reactions, NBS Circular 510, Supplement 2, U.S. Government Printing Office, Washington, D.C. 20402, 1960, iv + 37 pp, $0.35.

Tables of Chemical Kinetics, Homogeneous Reactions, Supplementary Tables, To Accompany Circular 510 and Supplements 1 and 2, NBS Monograph 34, U.S. Government Printing Office, Washington, D.C. 20402, 1961, $2.75.

PHYSICOCHEMICAL PROJECTS (Continued)

Tables of Chemical Kinetics, Homogeneous Reactions, Supplementary Tables, NBS Monograph 34, Vol. 2, U.S. Government Printing Office, Washington, D.C. 20402, 1964, $2.00.

Phase Diagrams for Ceramists, E. M. Levin, H. F. McMurdie, and F. P. Hall, The American Ceramic Society, 4055 N. High St., Columbus, Ohio 43214, 1956, 286 pp (811 phase diagrams).

Phase Diagrams for Ceramists, Part II, E. M. Levin and H. F. McMurdie, The American Ceramic Society, 4055 N. High St., Columbus, Ohio 43214, 1959, 153 pp (462 phase diagrams).

Phase Diagrams for Ceramists, E. M. Levin, C. R. Robbins, and H. F. McMurdie (7th compilation), The American Ceramic Society, 4055 N. High St., Columbus, Ohio 43214, 1964, 601 pp (2064 phase diagrams), $18.00 (discount to members).

Phase Equilibrium Diagrams of Oxide Systems, revised and redrawn by E. F. Osborn and A. Muan, The American Ceramic Society, 4055 N. High St., Columbus, Ohio 43214, (Ten 19″ × 23″ plates for three-oxide systems containing SiO_2, four of them for oxide phases in equilibrium with metallic iron. Reproductions of these plates appear in the 1964 compilation).

Constitution of Binary Alloys, M. Hansen and K. Anderko, McGraw-Hill Book Company, New York, N.Y. 10036, 1958, xix + 1305 pp, $39.50.

Constitution of Binary Alloys, First Supplement, R. P. Elliott, McGraw-Hill Book Company, New York, N.Y. 10036, 1965, xxxii + 877 pp, $35.00.

Stability Constants of Metal-Ion Complexes, Section I: Inorganic Ligands, compiled by Lars Gunnar Sillen; Section II: Organic Ligands, compiled by Arthur E. Martell; Special Publication No. 17, The Chemical Society, London, 1964, xviii + 754 pp, $23.00.

Solubilities of Inorganic and Metal Organic Compounds, A compilation of Solubility Data from the Periodical Literature, A. Seidell, 4th ed., W. F. Linke, American Chemical Society, 1155 16th St. N.W., Washington, D.C. 20036.
Vol. I, 1958, iv + 1287 pp, $32.50.
Vol. II, 1965, iv + 1914 pp, $32.50.

INDEXES

Consolidated Index of Selected Property Values: Physical Chemistry and Thermodynamics, Prepared by the Office of Critical Tables. A key to the contents of six compilations that present critically evaluated numerical property values. Publication 976, National Academy of Sciences—National Research Council Printing and Publishing Office, 2101 Constitution Ave., N.W., Washington, D.C. 20418, 1962, xxiii + 274 pp, $6.00.

CRYSTALLOGRAPHIC PROJECTS

Crystal Data, Classification of Substances by Space Groups and their Identification from Cell Dimensions, J. D. H. Donnay and Werner Nowacki, Memoir 60 of the Geological Society of America, 1954, ix + 719 pp, Geological Society of America, 419 W. 117 St., New York, N.Y. 10027 (out of print).

Crystal Data, Determinative Tables, second edition, J. D. H. Donnay, General Editor; Gabrielle Donnay, Assistant Editor; E. G. Cox, Inorganic Compounds; Olga Kennard, Organic Compounds; Murray Vernon King, Proteins; Monograph 5 of the American Crystallographic Association, 1963, x + 1,302 pp, $20.00. Polycrystal Book Service, P.O. Box 11567, Pittsburgh, Pa. 15238.

Crystal Structures, first edition, Ralph W. C. Wyckoff, Interscience Publishers, John Wiley & Sons, New York.
Section I: Chapters I to VIII, 1948, 378 pp, $13.50.
Section II: Chapters VIII–X, XIII, 1951, 509 pp, $17.00.
Section III: Chapters XIV, XV, Organic Index, 1953, 465 pp, $25.00.
Section IV: Chapters XI and XII, 1957, 261 pp, $8.00.
Supplement I: Additions to Chapters II to VII, 1951, 143 pp, $5.00.
Supplement II: Additions to Chapter XIII, 1953, 85 pp, $8.50.
Supplement III: Additions to Chapters II to VIII, 1958, 311 pp, $20.00.
Supplement IV: Additions to Chapters IX, X, XIII–XV, 1959, 509 pp, $22.00.
Supplement V: Additions to Chapters II to XV, Indexes, 1960, 513 pp, $26.50.

Crystal Structures, 2nd ed., Ralph W. C. Wyckoff, Interscience Publishers, John Wiley & Sons, New York.
Vol. I: Chapters I–IV, 1963, 467 pp, $17.50.
Vol. II: Chapters V–VII, 1964, 588 pp, $24.00.
Vol. III: Chapters VIII–X, 1965, 981 pp, $27.50.

Powder Diffraction Data File (PD-1), 16 Sets, American Society for Testing and Materials, 1916 Race St., Philadelphia, Pa. 19103.

[a] Index.

A Handbook of Lattice Spacings and Structures of Metals and Alloys, No. 4 of Pergamon Press series of monographs on Metal Physics and Physical Metallurgy. W. B. Pearson, Pergamon Press, Ltd., Headington Hill Hall, Oxford, England, also London, Edinburgh, New York, Paris, and Frankfurt, 1958, x + 1044 pp, $38.00.

International Tables for X-Ray Crystallography, Kathleen Lonsdale, general editor, Published for the International Union of Crystallography by the Kynoch Press, Witton, Birmingham 6, England. Also available from Polycrystal Book Service, P.O. Box 11567, Pittsburgh, Pa. 15238.

Vol. I: Symmetry Groups, Norman F. M. Henry and Kathleen Lonsdale, eds, 1952, xii + 558 pp, £5.5.0. ($14.70).

Vol. II: Mathematical Tables, John S. Kasper and Kathleen Lonsdale, eds, 1959, xviii + 444 pp, £5.15.0. ($16.50).

Vol. III: Physical and Chemical Tables, Caroline H. MacGillavry and Gerard D. Rieck, eds, 1962, xvi + 362 pp, £5.15.0. ($16.10).

The Barker Index of Crystals, A Method for the Identification of Crystalline Substances, Published for the Barker Index Committee by W. Heffer & Sons, Ltd., Cambridge, England.

Vol. I, Crystals of the Tetragonal, Hexagonal, Trigonal and Orthorhombic Systems, M. W. Porter and R. C. Spiller, 1951.

Part 1: Introduction and Tables, ix + 350 pp, £1.10.0. net ($4.20).

Part 2: Crystal Descriptions, x + 1,086 pp, £4.10.0. net ($12.60).
The two parts—£6.0.0. net ($16.80).

Vol. II, Crystals of the Monoclinic System, M. W. Porter and R. C. Spiller, 1956.

Part 1: Introduction and Tables, v + 383 pp.

Part 2: Crystal Descriptions, M.1 to M.1800, viii + 760 pp.

Part 3: Crystal Descriptions, M.1801 to M.3572, viii + 688 pp.
The three parts—£10.0.0. net ($28.00).

CRYSTALLOGRAPHIC PROJECTS (Continued)

Vol. III, Crystals of the Anorthic System, M. W. Porter and L. W. Codd, 1964.

Part 1: Introduction and Tables, vi + 50 pp., and unpaginated tables.

Part 2: Crystal Descriptions, A.1 to A.831 and Atlas of Configurations, vii pp + unpaginated descriptions.

The two parts—£12.0.0. net ($33.60).

MINERALOGICAL PROJECTS

The System of Mineralogy of James Dwight Dana and Edward Salibury Dana, Yale University, 1837–1892, 7th edition, John Wiley & Sons, Inc., 605 Third Ave., New York, N.Y. 10016; and Glen House, Stag Place, London, S.W.1., England.

Vol. I: Elements, Sulfides, Sulfosalts, Oxides; Charles Palache, Harry Berman, and Clifford Frondel, 1944, xiii + 834 pp, $14.00.

Vol. II: Halides, Nitrates, Borates, Carbonates, Sulfates, Phosphates, Arsenates, Tungstates, Molybdates, etc.; C. Palache, H. Berman, and C. Frondel, 1951 xi + 1124 pp, $16.00

Vol. III: Silica Minerals, C. Frondel, 1962, xii + 334 pp, $7.95.

Rock-Forming Minerals, W. A. Deer, J. Zussman, and R. A. Howie, Longmans, Green and Co., Ltd., 48 Grosvenor St., London, W.1, England. Rights in USA, Philippines, and Central America—John Wiley & Sons, Inc., 605 Third Ave., New York, N.Y. 10016.

Vol. I: 1962, 333 pp, $16.50.

Vol. II: 1963, 379 pp, $19.50.

Vol. III: 1962, 270 pp, $16.50.

Vol. IV: 1963, 435 pp, $16.50.

Vol. V: 1962, 371 pp, $16.50.

INDEXES

Indexes to Crystallographic Data Compilations. The American Society for Testing and Materials publishes the following indexes to the Powder Diffraction File (see p. 278). All ASTM publications are available from the American Society for Testing and Materials, 1916 Race St., Philadelphia, Pa. 19103.

a. Index to the Powder Diffraction File; Organic (Hanawalt), includes Section 1–16, PDIS–15o, bound, $15.00.

b. Index to the Powder Diffraction File; Inorganic (Hanawalt), includes Section 1–15, PDIS–16i, bound, $20.00.

c. Fink Inorganic Index to the Powder Diffraction File, PDIS–16f, bound, $15.00.

d. Matthews Coordinate Index to the Powder Diffraction File, Inorganic: Termatrex Cards, $675.00; Negative-Line Cards, $185.00.

GENERAL NUCLEAR PROPERTIES PROJECTS

Nuclear Data Sheets, Jan. 1958—. Vols. 5, and 6, 1958, 1959, 1960, 1961, published by the National Academy of Sciences—National Research Council, 2101 Constitution Avenue, Washington, D.C. 20418. Section B of the new journal "Nuclear Data" will be devoted to Nuclear Data Sheets. Vol. 1, No. 1, containing sheets for A-chains from $A = 182$ through $A = 185$, was issued in Feb. 1966.

1959 Nuclear Data Tables, U.S. Government Printing Office, Washington, D.C. 20402, April 1959, viii + 151 pp, $1.00.

1960 Nuclear Data Tables, U.S. Government Printing Office, Washington, D.C. 20402.

Part 1: Consistent Set of Q Values, $A \leq 66$, 1961, 214 pp, $1.50.

Part 2: Consistent Set of Q Values, $67 \leq A \leq 199$, 1961, 456 pp, $2.75.

Part 3: Nuclear Reaction Graphs, 1960 (out of print).

Part 4: Short Tables, 249 pp, 1961, $1.50.

Energy Levels of Light Nuclei, May 1962, T. Lauritsen and F. Ajzenberg, issued as Sets 5 and 6 of the 1961 Nuclear Data Sheets, essentially an addendum to a review article in **Nucl. Phys., 11,** 1–340 (1959).

Members of the Nuclear Data Project contributed the section **Energy Levels of Nuclei,** $A = 21$ to $A = 212$ of Group I, Vol. 1 of the New Series of Landolt-Börnstein, **Numerical Data and Functional Relationships in Science and Technology.**

Table of Isotopes, J. J. Livingood and G. T. Seaborg, **Rev. Mod. Phys., 12,** 30–47 (1940).

Table of Isotopes, G. T. Seaborg and I. Perlman, **Rev. Mod. Phys., 16,** 1–32 (1944).

GENERAL NUCLEAR PROPERTIES PROJECTS (Continued)

Table of Isotopes, G. T. Seaborg and I. Perlman, **Rev. Mod. Phys., 20,** 585–666 (1948).

Table of Isotopes, J. M. Hollander, I. Perlman, and G. T. Seaborg, **Rev. Mod. Phys., 25,** 469–650 (1953).

Table of Isotopes, D. Strominger, J. M. Hollander, and G. T. Seaborg, **Rev. Mod. Phys., 30,** No. 2, Part 2, 585–904 (1958). Also available from the American Institute of Physics, 335 E. 45th St., New York, N.Y. 10017.

Tabellen der Atomkerne (Nuclear Tables), W. Kunz and J. Schintlmeister. Teil (Part) I, Eigenschaften der Atomkerne (Nuclear Properties); Band (Volume) 1, Die Elemente Neutron bis Zinn (The Elements Neutron to Tin), 1958, xliv + 465 pp, Akademie-Verlag, G.m.b.H., Berlin W.8, Mohrenstrasse 39, Germany, price, 105 DM ($26.25). Teil I, Band 2, Eigenschaften der Atomkerne, Die Elemente Antimon bis Nobelium (Antimony to Nobelium), 1959, xliv + 641 pp (466–1107), price, 130 DM ($32.50). Akademie-Verlag, Berlin. (Also available from Pergamon Press, Headington Hill Hall, Oxford, England; 4/5 Fitzroy Square, London, W.1, England; 122 E. 55th St., New York, N.Y. 10022, £20.0.0 per set.)

Part II, Nuclear Reactions, Vol. 1, The Elements from Neutron to Magnesium, Text Volume, xliv + 700 pp. Table Volume, 36 tables (five of which require 2 or 3 sheets), 1965. Price £25.0.0. ($75.00) for the two volumes.

CROSS-SECTION PROJECTS

Neutron Cross Sections, BNL (Brookhaven National Laboratory) 325, 2nd ed, U.S. Government Printing Office, Washington, D.C. 20402, July 1958, v + 373 pp, $4.50.

> Supplement 1, U.S. Government Printing Office, Washington, D.C. 20402, January 1960, iv + 129 pp, $2.00.
>
> Supplement 2, Vol. I, Z=1 to 20, U.S. Government Printing Office, Washington, D.C. 20402, May 1964, Sectional pagination, $2.50.
>
> Supplement 2, Vol. IIA, Z=21 to 40, Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg. 22151, February 1966, sectional pagination, $4.00.
>
> Supplement 2, Vol. III, Z=88 to 98, Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg. 22151, February 1965, sectional pagination, $3.00.

Neutron Cross Sections—Angular Distributions, BNL 400, Clearinghouse for Federal Scientific and Technical Information, Virg. 22151, June 1956, 102 pp.
2nd ed, Angular Distributions in Neutron-Induced Reactions, Vol. I, Z=1 to 22; Vol. II, Z=23 to 94, Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg. 22151, October 1962, 804 pp, sectional pagination, $8.50.

> Part I, **Tabulated Neutron Cross Sections,** 0.001–14.5 MeV., R. J. Howerton, Vol. I, $_{1}$H–$_{22}$Ti; Vol. II, $_{23}$V–$_{50}$Sn; Vol. III, $_{51}$Sb–$_{95}$Am; UCRL-5226, first edition, May 1958. UCRL-5226, revised, 1959; Vol. I, $5.00, Vol. II, $5.00, Vol. III, $4.00, Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg. 22151.
>
> Part II, **Semi-Empirical Neutron Cross Sections,** 0.5–15 MeV., $_{1}$H–$_{94}$Pu, R. J. Howerton, Vol. I, Nov. 1958, UCRL-5351. (Photostat copy, $37.80, Microfilm copy, $11.10, available from the Library of Congress.)
>
> Part III, **Tabulated Differential Neutron Cross Sections,** $_{1}$H–$_{94}$Pu, R. J. Howerton, Vol. I, Jan. 1961, UCRL-5573, Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg. 22151, $5.00.

Charged Particle Cross Sections, LA-2014, Nelson Jarmie and John D. Seagrave, eds, Clearinghouse for Federal Scientific and Technical Information, Springfield, Virg. 22151, Feb. 1957, 234 pp, $1.25.

Charged Particle Cross Sections, LA-2424, Neon to Chromium, Darryl B. Smith, Compiler and ed, Nelson Jarmie and John D. Seagrave, associate eds, Clearinghouse for Scientific and Technical Information, Springfield, Virg. 22151, Jan. 1961, iii + 137 pp, $2.50.

Nuclear Cross Sections for Charged-Particle Induced Reactions, ORNL-CPX-1, Mn, Fe, Co, F. K. McGowan, W. T. Milner, and H. J. Kim, compilers, Oak Ridge National Laboratory, P.O. Box X, Oak Ridge, Tenn. 37831, July 1964, 443 pp.

Nuclear Cross Sections for Charged-Particle Induced Reactions, ORNL-CPX-2, Ni, Cu, F. K. McGowan, W. T. Milner, and H. J. Kim, compilers, Oak Ridge National Laboratory, P.O. Box X, Oak Ridge, Tenn. 37831, Sept. 1964, iii + 511 pp.

ENERGY LEVEL PROJECTS

Energy Levels of Light Nuclei

> III: W. F. Hornyak, Thomas Lauritsen, P. Morrison, and H. A. Fowler, **Rev. Mod. Phys., 22,** 291–372, (1950).
>
> IV: F. Ajzenberg and T. Lauritsen, **Rev. Mod. Phys., 24,** 321–402 (1952).

ENERGY LEVEL PROJECTS (Continued)

V: F. Ajzenberg and T. Lauritsen, **Rev. Mod. Phys. 27,** 77–166 (1955).

VI: F. Ajzenberg-Selove and T. Lauritsen, **Nucl. Phys.,** 11, 1–340 (1959). This report may be obtained for $10.00 from North Holland Publishing Company, P.O. Box 103, Amsterdam, the Netherlands.

Energy Levels of Light Nuclei, Z = 11 to Z = 20

I: P. M. Endt and J. C. Kluyver, **Rev. Mod. Phys., 26,** 95–166, (1954).

II: P. M. Endt and C. M. Braams, **Rev. Mod. Phys., 29,** 683–756 (1957).

III: P. M. Endt and C. van der Leun, **Nucl. Phys., 34,** 1–324 (1962). Reprints of this paper are obtainable for $10.00 from North Holland Publishing Company, P.O. Box 103, Amsterdam, the Netherlands.

Decay Schemes of Radioactive Nuclei, B. S. Dzhelepov and L. K. Peker, 1958, viii + 787 pp, USSR Academy of Sciences Press, Moscow and Leningrad. English translation of above, 1961, vi + 786 pp, Pergamon Press, New York, Oxford, London, Paris.

Decay Schemes of Radioactive Nuclei, A ≥ 100, B. S. Dzhelepov, L. K. Peker, and V. O. Sergejev, 1963, 1060 pp, USSR Academy of Sciences Press, Moscow and Leningrad.

ATOMIC SPECTRA

Atomic Energy Levels As Derived from the Analyses of Optical Spectra, Charlotte E. Moore, NBS Circular 467, U.S. Government Printing Office, Washington, D.C. 20402.

Vol. I: Hydrogen to Vanadium (Z = 1–23), 1949, 309 pp, $5.50.

Vol. II: Chromium to Niobium (Z = 24–41), 1952, 227 pp, $4.00.

Vol. III: Molybdenum to Lanthanum (Z = 42–57) and Hafnium to Actinium (Z = 72–89), 1958, 245 pp, $3.00.

Vol. IV: Lanthanide and Actinide groups; in preparation.

An Ultraviolet Multiplet Table, Charlotte E. Moore, NBS Circular 488, U.S. Government Printing Office, Washington, D.C. 20402.

Section 1, 1950, 85 pp, reprinted 1956.

Section 2, 1952, 120 pp, reprinted 1956.
Combined Sections 1 and 2, reprinted 1963, $1.25;

Section 3, 1962, 98 pp, 60 cents.
The first three sections include spectra of the elements in the corresponding volumes of Circular 467.

Section 4, 1962, 70 pp, 45 cents.
A Finding List for spectra of elements in Sections 1 and 2.

Section 5, 1962, 34 pp, 30 cents.
A Finding List for spectra of elements in Section 3.

Selected Tables of Atomic Spectra, Atomic Energy Levels and Multiplet Tables Si ii, Si iii, Si iv. NSRDS-NBS 3, Section 1, Charlotte E. Moore, U.S. Government Printing Office, Washington, D.C. 20402, June 1965, 40 pp, $0.35.

Atomic Transition Probabilities, A Critical Data Compilation; Vol. I, Hydrogen Through Neon, W. L. Wiese, M. W. Smith, and B. M. Glennon (NSRDS-NBS 4, Vol. I), U.S. Government Printing Office, Washington, D.C. 20402, May 1966, xi + 154 pp, $2.50.

INFRARED AND MICROWAVE SPECTRA

Selected Infrared Spectral Data, American Petroleum Institute Research Project 44, current loose-leaf sheets. As of June 30, 1966, there were 2813 valid sheets; sold as complete set 7 volumes at $0.30 per sheet, Texas A&M Research Foundation, College Station, Texas.

Selected Infrared Spectral Data, Thermodynamics Research Center, current loose-leaf sheets. As of June 30, 1966, there were 342 valid sheets. Sold as complete sets at $0.30 per sheet, Texas A&M Research Foundation, College Station, Texas.

Coblentz Society Spectra, set of 4,000 spectra, 1964, $115 per 1000. Indexes: Alphabetical Index, Molecular Formula Index, Chemical Classes Index, Numerical Index, $5.00 each, set of four, $10.00. Available from Sadtler Research Laboratories, Inc., 1517 Vine St., Philadelphia, Pa. 19102, to whom orders may be sent.

DMS (Documentation of Molecular Spectroscopy) Spectral Cards. The DMS card service is obtained by subscription from Butterworth & Co. (Publishers) Ltd., London, W.C.2, England, from Verlag Chemie, G.m.b.H., Weinheim an der Bergstrasse, West Germany. Volumes 1 through 6 contain 2000 cards, about 80 percent spectral and 20 percent literature. The spectral cards are supplied slotted or unslotted, the unslotted being marked according to the DMS code. The subscription includes a current literature list in a ring binder, the Junior Index, codes for the literature list, instruction and coding manual for the spectral cards, a formula list for each issue and the newsletters. Literature lists for nuclear magnetic resonance were begun in 1965. The prices for the DMS Spectral and Index cards are as follows:

Cards	Price		
	U.K. (£)	U.S. ($)	W. Germany (DM)
Spectral[a] (volume, each)			
1–4 (unslotted)	67. 0.0.	187.50	750.00
5–8 (unslotted)	75. 0.0.	210.00	840.00
1–4 (slotted)	80. 5.0.	225.00	900.00
5–8 (slotted)	88. 0.0.	247.00	988.00
9– (unslotted)	112.10.0.	315.00	1,260.00
9– (slotted)	130.10.0.	365.00	1,460.00
Index (sets)			
S-1 (1–4999) single	22. 5.0.	62.50	250.00
S-1 (1–4999) multiple	18. 0.0.	50.00	200.00
S-2 (5000–9999) single	26. 5.0.	73.50	295.00
S-2 (5000–9999) multiple	21. 0.0.	59.00	236.00

[a] Each volume consists of four issues, each issue containing about 400 spectral cards (pink) and 100 literature cards (yellow). From Issue 17 (beginning of Vol. 5), spectral cards for inorganic compounds (blue) are included and from Issue 25, the literature cards are replaced by literature lists.

The Infrared Data Committee of Japan Infrared Data Cards, published by Nankodo Co., Ltd., Harukicho, Bunkyo-ku, Tokyo, Japan. They are sold on a subscription basis at $238.00 for 1200 cards (postage included). Asian subscribers receive a special price of $150.00. Export agency is Sanyo Shuppan Bocki Co., Inc., P.O. Box 1705, Tokyo, Central Japan. The agent in the United States is the Preston Technical Abstracts Co., 909 Pitner Ave., Evanston, Ill. 60202. The agent in Europe is Heyden & Son Ltd., Spectrum House, Alderton Crescent, Hendon, London, N.W.4, England.

Standard Infrared Spectra (pure substances), Sadtler Research Laboratories, Inc., 3316 Spring Garden St., Philadelphia, Pa. 19104.

27 volumes of 1000 spectra each (complete through 1965), include alphabetical name, molecular formula, chemical classes, numerical, and commercial alphabetical indexes, $3,500.00 (or each volume $125.00, or indexes, set of five, $50.00).

1966 spectra by subscription, includes 2 volumes of 1000 spectra each, Nos. 27,001—29,000, five indexes and Spec-Finder, $350.00.

Standard spectra on 16-mm microfilm, prices same as above.

Sadtler Standard Grating Spectra, Sadtler Research Laboratories, Inc., 3316 Spring Garden St., Philadelphia, Pa. 19104.

Near Infrared Spectra
Completed set of 2000 spectra in 9 volumes, prices available upon request.

Far Infrared Spectra
Completed set of 500 spectra in 2 volumes, prices available upon request.

Commercial Spectra
Groups priced separately, prices available upon request.
Commercial Spec-Finder, $25.00.

The Red System ($A^2\pi - X^2\Sigma$) of the CN Molecule, Sumner P. Davis and John G. Phillips, University of California Press, Berkeley and Los Angeles, 1963, x + 214 pp, $9.50.

Spectral Data and Physical Constants of Alkaloids, J. Holubek and O. Štrouf, eds. Published by Heyden & Sons, Ltd., London, in cooperation with The Publishing House of the Czechoslovakia Academy of Sciences. Available in Western Europe and the Western Hemisphere from Heyden & Sons, Ltd., Spectrum House, Alderton Crescent, Hendon, London, N.W.4, England.

Vol. I, 1965, spectral cards 1–30 issued in two binders to take Vols. I and II, £23.0.0. ($69.00).

Vol. II, 1966, spectral cards 301–400, punched cards to be inserted in second binder, £7.0.0. ($21.00).

Microwave Spectral Tables, NBS Monograph 70, U.S. Government Printing Office, Washington, D.C. 20402.

Vol. I: Diatomic Molecules, Paul F. Wacker, Masataka Mizushima, Jean D. Peterson, and Joe R. Ballard, Dec. 1, 1964, xviii + 146 pp, 8″ × 10½″, $2.00.

Vol. II: Line Strengths of Asymmetric Rotors, Paul F. Wacker and Marlene R. Pratto, Dec. 15, 1964, xii + 340 pp, 8″ × 10½″, $3.00.

ELECTRONIC SPECTRA (ULTRAVIOLET AND VISIBLE)

Selected Ultraviolet Spectral Data, American Petroleum Institute Research Project 44, current loose-leaf sheets. As of June 30, 1966, there were 1076 valid sheets. Sold in complete sets, 3 volumes, at $0.30 per sheet. Texas A&M Research Foundation, College Station, Texas.

Selected Ultraviolet Spectral Data, Thermodynamics Research Center, current loose-leaf sheets. As of June 30, 1966, there were 126 valid sheets. Sold in complete sets at $0.30 per sheet. Texas A&M Research Foundation, College Station, Texas.

Organic Electronic Spectral Data, Interscience Publishers, a division of John Wiley & Sons, Inc., New York, London, and Sydney.

Vol. I, 1946–1952, M. J. Kamlet, ed, 1961, pp xiii + 1244, $25.00.

Vol. II, 1953–1955, H. E. Ungnade, ed, 1960, pp x + 919, $15.00.

Vol. III, 1956–1957, O. H. Wheeler and L. A. Kaplan, eds, 1966, xii + 1210 pp, $25.00.

Vol. IV, 1958–1959, J. P. Phillips and F. C. Nachod, eds, 1963, viii + 1179 pp, $20.00.

The "Sadtler Standard Ultraviolet Spectra" including alphabetical and numerical indexes are available on a subscription basis—$560.00 for the 1965 subscription (5000 spectra). The 11000 bound spectra previously issued sell for $1,265.00 including indexes. Individual spectra are priced at $0.15 each. The spectra are also available on 16-mm microfilm at the same price.

Orders and inquiries should be sent to Sadtler Research Laboratories, Inc., 3314–3320 Spring Garden St., Philadelphia, Pa. 19104.

Absorption Spectra in the Ultraviolet and Visible Region (a Theoretical and Technical Introduction), elaborated and edited by Dr. L. Láng; published in German and English in 1959, 2nd edition, 1961, 3rd edition, 1963, 80 pp, Co-production of the Academic Press, New York and London, and the Publishing House of the Hungarian Academy of Sciences, Budapest. Printed in English in Hungary. Available in both continents of America from Academic Press, Publishers, 111 Fifth Ave., New York, N.Y. 10003.

Absorption Spectra in the Ultraviolet and Visible Region, L. Láng, ed, Co-production of the Academic Press, New York and London, and the Publishing House of the Hungarian Academy of Sciences, Budapest Printed in English in Hungary. Available in both continents of America from Academic Press, Publishers, 111 Fifth Ave., New York, N.Y. 10003.

Vol. 1: Substances, 170, 1959, 414 pp + Index pamphlet, 24, 2nd edition, 1961, 3rd edition, 1963. Combined introduction and Vol. 1, $18.00.

Vol. 2: Substances, 179, 1961, 408 pp + Index pamphlet, 31, 2nd edition, 1964, $18.00.

Vol. 3: Substances, 172, 1962, 424 pp + Index pamphlet, 24, $20.00.

Vol. 4: Substances, 185, 1963, 414 pp + Index pamphlet, 24, $20.00.

Vol. 5: Substances, 192, 1965, 416 pp + Index pamphlet, 28. Cumulative Index, Vols. 1–5, 1965, 112 pp, $23.00.

Vol. 6: Substances, 197, 1966, 412 pp + Index pamphlet, 30, $23.00.

RAMAN SPECTRA

Selected Raman Spectral Data, American Petroleum Institute Research Project 44, current loose-leaf sheets. As of June 30, 1966, there were 501 valid data sheets. Sold in complete sets, 2 volumes, at $0.30 per sheet, Texas A&M Research Foundation, College Station, Texas.

Selected Raman Spectral Data, Thermodynamics Research Center, current loose-leaf sheets. As of June 30, 1966, there were 40 valid sheets. Sold as complete sets at $0.30 per sheet. Texas A&M Research Foundation, College Station, Texas.

MASS SPECTRA

Selected Mass Spectral Data, American Petroleum Institute Research Project 44, current loose-leaf sheets. As of June 30, 1966, there were 2342 valid sheets in the catalog. Sold as complete sets, 6 volumes, at $0.30 per sheet. Texas A&M Research Foundation, College Station, Texas.

Selected Mass Spectral Data, Thermodynamics Research Center, current loose-leaf sheets. As of June 30, 1966, there were 168 valid sheets. Sold as complete sets at $0.30 per sheet. Texas A&M Research Foundation, College Station, Texas.

Compilation of Mass Spectral Data (Index de Spectres de Masse), A. Cornu and R. Massot, 1966, xv + 617 pp, 8½″ × 11″. Published by Heyden & Sons Ltd., in cooperation with Presses Universitaires de France. Distributed by Heyden & Sons Ltd., Spectrum House, Alderton Crescent, London, N.W.4, England; $42.00.

NUCLEAR MAGNETIC RESONANCE SPECTRA

Selected Nuclear Magnetic Resonance Spectral Data, American Petroleum Institute Research Project 44, current loose-leaf sheets. As of June 30, 1966, there were 649 valid sheets. Sold as complete sets, 2 volumes, at $0.30 per sheet. Texas A&M Research Foundation, College Station, Texas.

Selected Nuclear Magnetic Resonance Spectral Data, Thermodynamics Research Center, current loose-leaf sheets. As of June 30, 1966, there were 551 valid sheets. Sold as complete sets, 2 volumes, at $0.30 per sheet. Texas A&M Research Foundation, College Station, Texas.

High Resolution NMR Spectra Catalog, Vol. I, 1962, N. S. Bhacca, L. F. Johnson, and J. N. Shoolery, compilers, Varian Associates, Instrument Division, Palo Alto, Calif. 94303, 43 pp + 368 spectra, $6.00; 10 or more copies, $4.50 each; student price, $5.00.

High Resolution NMR Spectra Catalog, Vol. II, 1963, N. S. Bhacca, D. P. Hollis, L. F. Johnson, and E. A. Pier, compilers, Varian Associates, Instrument Division, Palo Alto, Calif. 94303, x + 62 pp + 332 spectra; price same as Vol. I; combined edition, Vols. I and II, hard cover, $20.00.

LANDOLT-BÖRNSTEIN

Landolt-Börnstein: Zahlenwerte und Funktionen aus Physik, Chemie, Astronomie, Geophysik und Technik, sixth edition.

Volumes Published

- Vol. I: Atom—und Molekularphysik
  - Part 1, Atome und Ionen, 1950, xii + 441 pp., DM 126 ($31.50).
  - Part 2, Molekeln I: Kerngerüst, 1951, viii + 571 pp., DM 168 ($42.00).
  - Part 3, Molekeln II: Elektronenhülle, 1951, xi + 724 pp., DM 218 ($54.50).
  - Part 4, Kristalle, 1955, xi + 1,007 pp., DM 318 ($79.50).
  - Part 5, Atomkerne und Elementarteilchen, 1952, viii + 470 pp., DM 148 ($37.00).
- Vol. II: Eigenschaften der Materie in Ihren Aggregatzuständen
  - Part 2, Gleichgewichte ausser Schmelzgleichgewichten.
    - 2a, Gleichgewichte Dampf-Kondensat und Osmotische Phänomene, 1960, xi + 974 pp., DM 448 ($112.00).
    - 2b, Lösungsgleichgewichte I, 1962, x + 983 pp., DM 510 ($127.50).
    - 2c, Lösungsgleichgewichte II, 1964, viii + 731 pp., DM 403.5 ($100.88).
  - Part 3, Schmelzgleichgewichte und Grenzflächenerscheinungen, 1956, xi + 535 pp., DM 198 ($49.50).
  - Part 4, Kalorische Zustandsgrössen, 1961, xii + 863 pp., DM 438 ($109.50).
  - Part 6, Elektrische Eigenschaften I, 1959, xv + 1,018 pp., DM 448 ($112.00).
  - Part 7, Elektrische Eigenschaften II, 1960, xii + 959 pp., DM 478 ($119.50).
  - Part 8, Optische Konstanten, 1962, xv + 901 pp., DM 476 ($119.00).
  - Part 9, Magnetische Eigenschaften I, 1962, xxv + 1,934 pp., DM 496 ($124.00).
- Vol. III: Astronomie und Geophysik, 1952, xviii + 795 pp., DM 248 ($62.00).
- Vol. IV: Technik
  - Part 1, Stoffwerte und mechanisches Verhalten von Nichtmetallen, 1955, xvi + 881 pp., DM 288 ($72.00).
  - Part 2, Stoffwerte und Verhalten von metallischen Werkstoffen.
    - 2a, Grundlagen, Prüfverfahren, Eisenwerkstoffe, 1963, xii + 888 pp., DM 468 ($117.00).
    - 2b, Sinterwerkstoffe, Schwermetalle (ohne Sonderwerkstoffe), 1964, xx + 1,000 pp., DM 530 ($132.50).
    - 2c, Leichtmetalle, Sonderwerkstoffe, Halbleiter, Korrosion, 1965, xx + 976 pp., DM 518 ($129.50).
  - Part 3, Elektrotechnik, Lichttechnik, Röntgentechnik, 1957, xv + 1,076 pp., DM 396 ($99.00).

Volumes in Preparation

- Vol. II: Eigenschaften der Materie in Ihren Aggregatzuständen
  - Part 1, Mechanisch-thermische Zustandgrössen.
  - Part 5, Physikalische und chemische Kinetik.
  - Part 10, Magnetische Eigenschaften II.
- Vol. IV: Technik
  - Part 4, Wärmetechnik.

LANDOLT-BÖRNSTEIN

Landolt-Börnstein: Zahlenwerte und Functionen aus Naturwissenschaften und Technik, Neue Serie—Numerical Data and Functional Relationships in Science and Technology, New Series, K. H. Hellwege, editor-in-chief.

Volumes Published

Group I: Kernphysik und Kerntechnik—Nuclear Physics and Technology
- Vol. I, Energy Levels of Nuclei: A = 5 to A = 257, A. M. Hellwege and K. H. Hellwege, eds., 1961, xii + 813 pp., DM 212 ($53.00).

Group II: Atom und Molekularphysik—Atomic and Molecular Physics
- Vol. I, Magnetische Eigenschaften Freier Radikale—Magnetic Properties of Free Radicals, K. H. Hellwege and A. M. Hellwege, eds., 1965, x + 154 pp., DM 68 ($17.00).

Group VI: Astronomie, Astrophysik und Weltraum-Forschung—Astronomy, Astrophysics and Space Research
- Vol. I, Astronomie und Astrophysik—Astronomy and Astrophysics, H. H. Voigt, ed., 1965, xxxix + 711 pp., DM 314 ($78.50).

Other groups planned and volumes expected to be published in 1966 or 1967:

Group I: Nuclear Physics and Technology
- Hilfstabellen für α-, β-, γ- Spektroskopie—Auxiliary Tables for α-, β-, γ- Spectroscopy.
- Ladungs-und Dichteverteilung im Kern—Charge and Density Distribution in the Nucleus.

Group II: Atomic and Molecular Physics
- Vol. I, Lumineszenz organischer Molekeln—Luminescence of Organic Molecules.
  - Mikrowellenspektroskopie von Molekeln—Microwave Spectroscopy of Molecules.
  - Molekularakustik—Molecular Acoustics.
- Vol. II, Magnetische Eigenschaften der Koordinations und metallorganischen Verbindungen der Übergangselemente—Magnetic Properties of Co-ordination and Organometallic Compounds of Transition Elements.

Group III: Crystal and Solid State Physics
- Elastische, elastooptische, piezoelektrische und andere Eigenschaften von Einkristallen—Elastic, Elasto-optic, Piezoelectric and Other Properties of Single Crystals.

Group IV: Macroscopic and Technical Properties of Matter
- Phosphoreszenz anorganischer Substanzen—Phosphorescence (Luminescence) of Inorganic Substances.

Group V: Geophysics and Space Research
- Aeronomy; Cosmic Radiation.

Published by Springer-Verlag, Berlin, Heidelberg, and New York. Also available from Walter J. Johnson, Inc., 111 Fifth Ave., New York, N.Y. 10003, and Stechert-Hafner, Inc., 31 E. 10th St., New York, N.Y. 10003.

TABLES DE CONSTANTES SELECTIONNEES—TABLES OF SELECTED CONSTANTS

Tables de Constantes Sélectionnées—Tables of Selected Constants

Vol. 1. Longueurs d'Onde d'Emissions X et des Ciscontinuités d'Absorption X-Wavelengths of Emission and Discontinuities in Absorption of X-Rays, Y. Cauchois and H. Hulubei, 1947, 199 pp. (out of print).

Vol. 2. Physique Nucléaire—Nuclear Physics, R. Grégoire, F. Joliot-Curie, and I. Joliot-Curie, 1948, 131 pp. (out of print).

Vol. 3. Pouvoir Rotatoire Magnétique (Effet Faraday)—Magnetic Rotatory Power (Faraday Effect); R. de Mallemann, Effet Magnéto-Optique de Kerr—Magneto-Optic Effect (Kerr), F. Suhner, 1951, 137 pp., 15 F, £1.10.0. ($4.50).

Vol. 4. Données Spectroscopiques Concernant les Molécules Diatomiques—Spectroscopic Data for Diatomic Molecules, B. Rosen, R. F. Barrow, A. D. Caunt, A. R. Downie, R. Herman, E. Huldt, A. MacKellar, E. Miescher, and K. Wieland, 1951, 361 pp., 48 F, £5.0.0. ($15.00).

Vol. 5. Atlas des Longueurs d'Onde Caractéristiques des Bandes d'Emission et d'Absorption des Molécules Diatomiques—Atlas of Characteristic Wavelengths for Emission and Absorption Bands of Diatomic Molecules (a continuation of Vol. 4 by the same authors), 1952, 389 pp., 56 F, £5.15.0 ($17.50).

Vol. 6. Pouvoir Rotatoire Naturel I-Steroïdes—Optical Rotatory Powers I-Steroids, J.-P. Mathieu and A. Petit, 1956, 507 pp. (out of print).

Vol. 7. Diamagnétisme et Paramagnétisme—Diamagnetism and Paramagnetism, G. Foëx; Relaxation Paramagnétique—Paramagnetic Relaxation, C. J. Gorter and L. J. Smits, 1957, 317 pp., 97 F, £9.15.9. ($29.00).

Vol. 8. Potentiels d'Oxydo-Réduction—Oxidation-Reduction Potentials, G. Charlot, D. Bézier, and J. Courtot, 1958, 41 pp., 21.60 F, £1.10.0 ($5.00).

Vol. 9. Pouvoir Rotatoire Naturel II-Triterpénoïdes—Optical Rotatory Power II-Triterpenoids, J.-P. Mathieu and G. Ourisson, 1958, 302 pp., 93.60F, £7.0.0. ($21.00)

Vol. 10. Pouvoir Rotatoire Naturel III-Amino-acides—Optical Rotatory Power III-Amino Acids, J.-P. Mathieu, J. Roche, and P. Desnuelle, 1959, 61 pp., 28 F, £2.0.0. ($6.50).

TABLES DE CONSTANTES SELECTIONNEES—TABLES OF SELECTED CONSTANTS (Continued)

Vol. 11. Pouvoir Rotatoire Naturel IV-Alcaloïdes—Optical Rotatory Power IV-Alkaloids, J.-P. Mathieu and M. M. Janot, 1959, 211 pp., 110.40 F, £8.0.0. ($24.00).

Vol. 12. Semi-Conducteurs—Semi-Conductors, P. Aigrain and J. Balkanski, 1961, 78 pp., 27 F, £2.0.0. ($6.50).

Vol. 13. Rendements Radiolytiques—Radiolytic Yields, M. Haïssinsky and M. Magat, 1963, 230 pp., 114 F, £8.10.0. ($25.50).

Vol. 14. Pouvoir Rotatoire Naturel Ia-Stéroïdes—Optical Rotatory Power Ia-Steroids, J. Jacques, H. Kagan, G. Ourisson, and S. Allard, 1965, 1,046 pp., 258 F.

Vol. 15. Données Relatives aux Sesquiterpenoïdes—Data Relative to Sesquiter-penoids, G. Ourisson, S. Munavalli, and C. Ehret, 1966, 70 pp.

In Preparation

Metals of High Purity, 1967

Refractory Compounds

There have been several publishers for the present series. Volume 8 and later volumes have been published by Pergamon Press from whom the earlier volumes as well as the titles, availability, and prices of the 40 installments of Tables Annuelles, covering the period 1931–1936, may be obtained.

Published by Pergamon Press, 4 and 5 Fitzroy Square, London, W.1, England; 122 E. 55th St., New York, N.Y., U.S.; and 24 rue des Ecoles, Paris V^e, France.

INTERNATIONAL CRITICAL TABLES

International Critical Tables of Numerical Data, Physics, Chemistry and Technology, published for the National Academy of Sciences—National Research Council, by McGraw-Hill Book Co., 330 W. 42nd St., New York, N. Y. 10036.

Vol. I, 1926, xx + 415 pp.
Vol. II, 1927, xviii + 616 pp.
Vol. III, 1928, xiv + 444 pp.
Vol. IV, 1928, viii + 481 pp.
Vol. V, 1929, ix + 465 pp.
Vol. VI, 1929, x + 471 pp.
Vol. VII, 1930, ix + 507 pp.
Index, 1933, vii + 321 pp.

Seven volumes and Index, $250.00; Vols. I-VII and Index, each $35.00.

NATIONAL STANDARD REFERENCE DATA SYSTEM PUBLICATIONS

The National Standard Reference Data System (NSRDS) comprises the set of data centers and other data evaluation projects administered or coordinated by Office of Standard Reference Data in the National Bureau of Standards. The primary aim of this program is to provide critically evaluated physical and chemical data, in a convenient and accessible form, to the scientific and technical community of the United States. The scope of the program is divided into the following areas:

Energy and environmental data
Industrial process data
Materials utilization data
Physical sciences data

The principal output of the program consists of compilations of evaluated data and critical reviews of the status of data in particular technical areas. Evaluated data produced under the NSRDS program are disseminated through the following mechanisms:

Journal of Physical and Chemical Reference Data—A quarterly journal containing data compilations and critical data reviews, published for the National Bureau of Standards by the American Institute of Physics and the American Chemical Society

NSRDS-NBS Series—A publication series distributed by the Superintendent of Documents, U.S. Government Printing Office.

Appropriate publications of technical societies and commercial publishers.

Response by OSRD and individual data centers to inquiries for specific data.

Further information on NSRDS publications, sources of data, and support of data compilation activities can be obtained from:

Office of Standard Reference Data
National Bureau of Standards

27. *Survey of Photochemical and Rate Data for Twenty-eight Reactions of Interest in Atmospheric Chemistry,* R. F. Hampson, Editor, W. Braun, R. L. Brown, D. Garvin, J. T. Herron, R. E. Huie, M. J. Kurylo, A. H. Laufer, J. D. McKinley, H. Okabe, M. D. Scheer, W. Tsang, and D. H. Stedman, Vol. 2, No. 2 (1973). $4.50.
28. *Compilation of the Static Dielectric Constant of Inorganic Solids,* K. F. Young and H. P. R. Frederikse, Vol. 2, No. 2 (1973). $6.50.
29. *Soft X-Ray Emission Spectra of Metallic Solids: Critical Review of Selected Systems,* A. J. McAlister, R. C. Dobbyn, J. E. Cuthill, and M. L. Williams, Vol. 2, No. 2 (1973). $3.00.
30. *Ideal Gas Thermodynamic Properties of Ethane and Propane,* J. Chao, R. C. Wilhoit, and B. J. Zwolinski, Vol. 2, No. 2 (1973). $3.00.
31. *An Analysis of Coexistence Curve Data for Several Binary Liquid Mixtures Near Their Critical Points,* A. Stein and G. F. Allen, Vol. 2, No. 3 (1973). $4.00.
32. *Rate Constants for the Reactions of Atomic Oxygen (O^3P) with Organic Compounds in the Gas Phase,* John T. Herron and Robert E. Huie, Vol. 2, No. 3 (1973). $5.00.
33. *First Spectra of Neon, Argon, and Xenon 136 in the 1.2—4.0 μm Region,* Curtis J. Humphreys, Vol. 2, No. 3 (1973). $3.00.
34. *Elastic Properties of Metals and Alloys, I. Iron, Nickel, and Iron-Nickel Alloys,* H. M. Ledbetter and R. P. Reed, Vol. 2, No. 3 (1973). $6.00.
35. *The Viscosity and Thermal Conductivity Coefficients of Dilute Argon,* Krypton, and Xenon, H. J. M. Hanley, Vol. 2, No. 3 (1973). $4.00.
36. *Diffusion in Copper and Copper Alloys. Part I. Volume and Surface Self-Diffusion in Copper,* Daniel B. Butrymowicz, John R. Manning, and Michael E. Read, Vol. 2, No. 3 (1973). $3.00.
37. *The 1973 Least-Squares Adjustment of the Fundamental Constants,* E. Richard Cohen and B. N. Taylor, Vol. 2, No. 4 (1973). $5.50.
38. *The Viscosity and Thermal Conductivity Coefficients of Dilute Nitrogen and Oxygen,* H. J. M. Hanley and James F. Ely, Vol. 2, No. 4 (1973). $4.00.
39. *Thermodynamic Properties of Nitrogen Including Liquid and Vapor Phases from 63 K to 2000 K with Pressures to 10,000 Bar,* Richard T. Jacobsen and Richard B. Stewart, Vol. 2, No. 4 (1973). $8.50.
40. *Thermodynamic Properties of Helium 4 from 2 to 1500 K at Pressures to 10^8 Pa,* Robert D. McCarty, Vol. 2, No. 4 (1973) . $7.00.
41. *Molten Salts: Volume 4, Part I, Fluorides and Mixtures, Electrical Conductance, Density, Viscosity, and Surface Tension Data,* G. J. Janz, G. L. Gardner, Ursula Krebs, and R. P. T. Tomkins, Vol. 3, No. 1 (1974). $7.00.
42. *Ideal Gas Thermodynamic Properties of Eight Chloro- and Fluoromethanes,* A. S. Rodgers, J. Chao, R. C. Wilhoit, and B. J. Zwolinski, Vol. 3, No. 1 (1974). $4.00.
43. *Ideal Gas Thermodynamic Properties of Six Chloroethanes,* J. Chao, A. S. Rodgers, R. C. Wilhoit, and B. J. Zwolinski, Vol. 3, No. 1 (1974). $4.00.
44. *Critical Analysis of Heat-Capacity Data and Evaluation of Thermodynamic Properties of Ruthenium, Rhodium, Palladium, Iridium, and Platinum from 0 to 300 K. A Survey of the Literature Data on Osmium,* George T. Furukawa, Martin L. Reilly, and John S. Gallagher, Vol. 3, No. 1 (1974). $4.50.
45. *Microwave Spectra of Molecules of Astrophysical Interest. V. Water Vapor,* Frank C. DeLucia, Paul Helminger, and William H. Kirchhoff, Vol. 3, No. 1 (1974). $3.00.
46. *Microwave Spectra of Molecules of Astrophysical*

Interest. VI. Carbonyl Sulfide and Hydrogen Cyanide, Arthur G. Maki, Vol. 3, No. 1 (1974). $4.00.

47. *Microwave Spectra of Molecules of Astrophysical Interest. VII. Carbon Monoxide, Carbon Monosulfide, and Silicon Monoxide*, Frank J. Lovas and Paul H. Krupenie, Vol. 3, No. 1 (1974). $3.00.
48. *Microwave Spectra of Molecules of Astrophysical Interest. VIII. Sulfur Monoxide*, Eberhard Tiemann, Vol. 3, No. 1 (1974). $3.00.
49. *Tables of Molecular Vibrational Frequencies, Part 8*, T. Shimanouchi, Vol. 3, No. 1 (1974). $4.50.
50. *JANAF Thermochemical Tables, 1974 Supplement*, M. W. Chase, J. L. Curnutt, A. T. Hu, H. Prophet, A. N. Syverud, and L. C. Walker, Vol. 3, No. 2 (1974). $8.50.
51. *High Temperature Properties and Decomposition of Inorganic Salts, Part 4. Oxy-Salts of the Halogens*, Kurt H. Stern, Vol. 3. No. 2 (1974). $4.50.
52. *Diffusion in Copper and Copper Alloys, Part II. Copper-Silver and Copper-Gold Systems*, Daniel B. Butrymowicz, John R. Manning, and Michael E. Read, Vol. 3, No. 2 (1974). $5.50.
53. *Microwave Spectral Tables. I. Diatomic Molecules*, Frank J. Lovas and Eberhard Tiemann, Vol. 3, No. 3(1974). $8.50.
54. *Ground Levels and Ionization Potentials for Lanthanide and Actinide Atoms and Ions*, W. C. Martin, Lucy Hagan, Joseph Reader, and Jack Sugar, Vol. 3, No. 3 (1974). $3.00.
55. *Behavior of the Elements at High Pressure*, John Francis Cannon, Vol. 3, No. 3 (1974). $4.50.
56. *Reference Wavelengths from Atomic Spectra in the Range 15A to 25000A*, Victor Kaufman and Bengt Edlen, Vol. 3, No. 4 (1974). $5.50.
57. *Elastic Properties of Metals and Alloys. II. Copper*, H. M. Ledbetter and E. R. Naimon, Vol. 3, No. 4 (1974). $4.50.
58. *Critical Review of Hydrogen Atom Transfer Reactions in the Liquid Phases*, D. G. Hendry, T. Mill, J. A. Howard, L. Piszkiewicz, and H. K. Eigenmann, Vol. 3, No. 4 (1974). $4.50.
59. *The Viscosity and Thermal Conductivity Coefficients for Dense Gaseous and Liquid Argon, Krypton, Xenon, Nitrogen, and Oxygen*, H. J. M. Hanley, R. D. McCarty, and W. N. Haynes, Vol. 3, No. 4 (1974). $4.50.
60. *JANAF Thermochemical Tables, 1975 Supplement*, M. W. Chase, J. L. Curnutt, H. Prophet, R. A. McDonald, and A. N. Syverud, Vol. 4, No. 1 (1975). $8.50.
61. *Diffusion in Copper and Copper Alloys. Part III. Diffusion in Systems Involving Elements of the Groups IA, IIA, IIIB, IVB, VB, VIB, and VIIB*, Daniel B. Butrymowicz, John R. Manning, and Michael E. Read, Vol. 4, No. 1 (1975). $6.00.
62. *Ideal Gas Thermodynamic Properties of Ethylene and Propylene*, Jing Chao and Bruno J. Zwolinski, Vol. 4, No. 1 (1975). $3.00.
63. *Atomic Transition Probabilities for Scandium and Titanium (A Critical Data Compilation of Allowed Lines)*, W. L. Wiese and J. R. Fuhr, Vol. 4, No. 2 (1975). $6.00.
64. *Energy Levels of Iron, Fe I through Fe XXVI*, Joseph Reader and Jack Sugar, Vol. 4, No. 2 (1975). $6.00.
65. *Ideal Gas Thermodynamic Properties of Six Fluoroethanes*, S. S. Chen, A. S. Rodgers, J. Chao, R. C. Wilhoit, and B. J. Zwolinski, Vol. 4, No. 2 (1975). $3.00.
66. *Ideal Gas Thermodynamic Properties of the Eight Bromo— and Iodomethanes*, S. A. Kudchadker and A. P. Kudchadker, Vol. 4, No. 2 (1975). $3.00.
67. *Atomic Form Factors, Incoherent Scattering Functions, and Photon Scattering Cross Sections*, J. H. Hubbell, Wm. J. Veigele, E. A. Briggs, R. T. Brown, D. T. Cromer, and R. J. Howerton, Vol. 4, No. 3 (1975). $5.50.
68. *Binding Energies in Atomic Negative Ions*, H. Hotop and W. C. Lineberger, Vol. 4, No. 3 (1976). $4.50.
69. *A Survey of Electron Swarm Data*, J. Dutton, Vol. 4, No. 3 (1975). $12.00.
70. *Ideal Gas Thermodynamic Properties and Isomerization of n-Butane and Isobutane*, S. S. Chen, R. C. Wilhoit, and B. J. Zwolinski, Vol. 4, No. 4 (1975). $3.00.
71. *Molten Salts: Volume 4, Part 2, Chlorides and Mixtures, Electrical Conductance, Density, Viscosity, and Surface Tension Data*, G. J. Janz, R. P. T. Tomkins, C. B. Allen, J. R. Downey, Jr., G. L. Gardner, U. Krebs, and S. K. Singer, Vol. 4, No. 4 (1975). $13.00.
72. *Property Index to Volumes 1—4 (1972—1975)*, Vol. 4, No. 4 (1975). $3.00.
73. *Scaled Equation of State Parameters for Gases in the Critical Region*, J. M. L. Levelt- Sengers, W. L. Greer, and J. V. Sengers, Vol. 5, No. 1 (1975). $5.00.
74. *Microwave Spectra of Molecules of Astrophysical Interest. IX. Acetaldehyde*, A. Bauder, F. J. Lovas, and D. R. Johnson, Vol. 5, No. 1 (1976). $4.00.
75. *Microwave Spectra of Molecules of Astrophysical Interest. X. Isocyanic Acid*, G. Winnewisser, W. H. Hocking, and M. C. L. Gerry, Vol. 5, No. 1 (1976). $4.00.
76. *Diffusion in Copper and Copper Alloys. Part IV. Diffusion in Systems Involving Elements of Group VIII*, Daniel B. Butrymowicz, John R. Manning, and Michael E. Read, Vol. 5, No. 1 (1976). $6.50.
77. *A Critical Review of the Stark Widths and Shifts of Spectral Lines from Non-Hydrogenic Atoms*, N. Konjevic and J. R. Roberts, Vol. 5, No. 2 (1976). $5.00.
78. *Experimental Stark Widths and Shifts for Non-Hydrogenic Spectral Lines of Ionized Atoms*, N. Konjevic and W. L. Wiese, Vol 5, No. 2 (1976). $5.00.
79. *Atlas of the Absorption Spectrum of Nitric Oxide (NO) between 1420 and 1250 A*, E. Miescher and F. Alberti, Vol. 5, No. 2 (1976). $3.00.
80. *Ideal Gas Thermodynamic Properties of Propanone and 2-Butanone*, J. Chao and B. J. Zwolinski, Vol. 5, No. 2 (1976). $3.00.
81. *Refractive Index of Alkali Halides and Its Wavelength and Temperature Derivatives*, H. H. Li, Vol. 5, No. 2 (1976). :9.50.
82. *Tables of Critically Evaluated Oscillator Strengths*

for the Lithium Isoelectronic Sequence, G. A. Martin and W. L. Wiese, Vol. 5, No. 3 (1976). $4.50.

83. *Ideal Gas Thermodynamic Properties of Six Chlorofluoromethanes,* S. S. Chen, R. C. Wilhoit, and B. J. Zwolinski, Vol. 5, No. 3 (1976). $3.00.
84. *Survey of Superconductive Materials and Critical Evaluation of Selected Properties,* B. W. Roberts, Vol. 5, No. 3 (1976). $12.50.
85. *Nuclear Spins and Moments,* Gladys H. Fuller, Vol. 5, No. 4 (1976). $11.50.
86. *Nuclear Moments and Moment Ratios as Determined by Mossbauer Spectroscopy,* J. G. Stevens and B. D. Dunlop, Vol. 5, No. 4 (1976). $4.00.
87. *Rate Coefficients for Ion-Molecule Reactions. I. Ions Containing C and H,* L. Wayne Sieck and Sharon G. Lias, Vol. 5, No. 4 (1976). $4.00.
88. *Microwave Spectra of Molecules of Astrophysical Interest. XI. Silicon Sulfide,* Eberhard Tiemann, Vol. 5, No. 4 (1976). $3.00.
89. *Property Index and Author Index to Volume 1—5 (1972—1976),* Vol. 5, No. 4 (1976). $4.00.
90. *Diffusion in Copper and Copper Alloys. Part V. Diffusion in Systems involving Elements of Group VA,* Daniel B. Butrymowicz, John R. Manning, and Michael E. Read, Vol. 6, No. 1 (1977). $5.00.
91. *The Calculated Thermodynamic Properties of Superfluid Helium-A,* James S. Brooks and Russell J. Donnelly, Vol. 6, No. 1 (1977). $5.00.
92. *Thermodynamic Properties of Normal and Deuterated Methanols,* S. S. Chen, R. C. Wilhoit, and B. J. Zwolinski, Vol. 6, No. 1 (1977). $3.00.
93. *The Spectrum of Molecular Nitrogen,* Alf Lofthus and Paul H. Krupenie, Vol. 6, No. 1 (1977). $9.50.

Supplements to the *Journal of Physical and Chemical Reference Data**

Physical and Thermodynamic Properties of Aliphatic Alcohols, R. C. Wilhoit and B. J. Zwolinski, Vol. 2, Supplement 1, 420 pp. (1973). Hardcover: $33.00; Softcover: members $10.00; nonmembers $30.00.

Thermal Conductivity of the Elements: A Comprehensive Review, C. Y. Ho, R. W. Powell, and P. E. Liley, Vol. 3, Supplement 1, 796 pp. (1974). Hardcover: $60.00; Softcover: members $25.00, nonmembers $50.00.

Energetics of Gaseous Ions, H. M. Rosenstock, K. Draxl, B. Steiner, and J. T. Herron, Vol. 6, Supplement 1, 783 pp. (1977). Hardcover: $70.00; Softcover: member $30.00, nonmember $65.00.

* Available from the Business Operations, Books and Journals Division, American Chemical Society, 1155 16th Street, N. W., Room 604, Washington, D.C. 20036.

Publications in the National Standard Reference Data Series

NSRDS-NBS-1, *National Standard Reference Data System — Plan of Operation,* E. L. Brady and M. B. Wallenstein (1964). SD Catalog No. C13.48:1. $0.55.

NSRDS-NBS-2, *Thermal Properties of Aqueous Uniunivalent Electrolytes,* V. B. Parker (1965). SD Catalog No. C13.48:2. $1.10.

NSRDS-NBS-3, Sec. 1, *Selected Tables of Atomic Spectra, Atomic Energy Levels and Multiplet Tables, Si II, Si III, Si IV,* C. E. Moore (1965).*

NSRDS-NBS-3, Sec. 2, *Selected Tables of Atomic Spectra, Atomic Energy Levels and Multiplet Tables, Si I,* C. E. Moore (1967).**

NSRDS-NBS-3, Sec. 3, *Selected Tables of Atomic Spectra, Atomic Energy Levels and Multiplet Tables, C I, C II, C III, C IV, C V, C VI,* C. F. Moore (1970).*

NSRDS-NBS-3, Sec. 4, *Selected Tables of Atomic Spectra, Atomic Energy Levels and Multiplet Tables, N IV, N V, N VI, N VII,* C. E. Moore (1971). SD Catalog No. C13.48:3/Sec. 4. $1.15.

NSRDS-NBS-3, Sec. 5, *Selected Tables of Atomic Spectra, Atomic Energy Levels and Multiplet Tables, N I, N II, N III,* C. E. Moore (1975). SD Catalog No. C13.48:3/Sec. 5.

NSRDS-NBS-3, Sec. 6, *Selected Tables of Atomic Spectra, Atomic Energy Levels and Multiplet Tables, H I, D, T,* C. E. Moore (1972). SD Catalog No. C13.48:3/Sec. 6. $0.40.

NSRDS-NBS 3, Sec. 7, *Selected Tables of Atomic Spectra, Atomic Energy Levels and Multiplet Tables, O I,* C. E. Moore (1976). SD Catalog No. C13.48:3/Sec. 7. $0.85.

NSRDS-NBS-4, *Atomic Transition Probabilities. Vol. I. Hydrogen Through Neon,* W. L. Wiese, M. W. Smith, and B. M. Glennon (1966). SD Catalog No. C13.48:4/Vol. I. $2.50.

NSRDS-NBS-5, *The Band Spectrum of Carbon Monoxide,* P. H. Krupenie (1966).**

NSRDS-NBS-6, *Tables of Molecular Vibrational Frequencies, Part 1,* T. Shimanouchi (1967). Superseded by NSRDS-NBS-39.

NSRDS-NBS-7, *High Temperature Properties and Decomposition of Inorganic Salts, Part I. Sulfates,*K. H. Stern and E. L. Weise (1966).*

NSRDS-NBS-8, *Thermal Conductivity of Selected Materials,* R. W. Powell, C. Y. Ho, and P. E. Liley (1966). PB 189 698.**

NSRDS-NBS-9, *Tables of Bimolecular Gas Reactions,* A. F. Trotman-Dickenson and G. S. Milne (1967).**

NSRDS-NBS-10, *Selected Values of Electric Dipole Moments for Molecules in the Gas Phase,* R. D. Nelson, Jr., D. R. Lide, Jr. and A. A. Maryott (1967).**

NSRDS-NBS-11, *Tables of Molecular Vibrational Frequencies, Part 2,* T. Shimanouchi (1967). Superseded by NSRDS-NBS-39.

NSRDS-NBS-12, *Tables for the Rigid Asymmetric Rotor: Transformation Coefficients from Symmetric to Asymmetric Bases and Expectation Values of* P^2_z, P^4_z, P^6_z, R. H. Schwendeman (1968). SD Catalog No. C13.48:12. $1.45.

NSRDS-NBS-13, *Hydrogenation of Ethylene on Metallic Catalysts,* J. Horiuti and K. Miyahara (1968). SD Catalog No. C13.48:13. $3.00.

NSRDS-NBS-14, *X-Ray Wavelengths and X-Ray Atomic Energy Levels,* J. A. Bearden (1967).**

NSRDS-NBS-15, *Molten Salts: Vol. 1. Electrical Conductance, Density, and Viscosity Data,* G. J. Janz, F. W. Dampier, G. R. Lakshminarayana, P. K. Lorenz, and R. P. Tomkins (1968).**

NSRDS-NBS-16, *Thermal Conductivity of Selected Materials, Part 2,* C. Y. Ho, R. W. Powell, and P. E. Liley (1968).**

NSRDS-NBS-17, *Tables of Molecular Vibrational Frequencies, Part 3,* T. Shimanouchi (1968). Superseded by NSRDS-NBS-39.

NSRDS-NBS-18, *Critical Analysis of the Heat-Capacity Data of the Literature and Evaluation of Thermodynamic Properties of Copper, Silver, and Gold from 0 to 300 K,* G. T. Furukawa, W. G. Saba, and M. L. Reilly (1968). S. D. Catalog No. C13.48:18. $0.40.

NSRDS-NBS-19, *Thermodynamic Properties of Ammonia as an Ideal Gas,* L. Haar (1968). SD Catalog No. C13.48:19, $0.20.

NSRDS-NBS-20, *Gas Phase Reaction Kinetics of Neutral Oxygen Species,* H. S. Johnston (1968).*

NSRDS-NBS-21, *Kinetic Data on Gas Phase Unimolecular Reactions,* S. W. Benson and H. E. O'Neal (1970). PB191956**

NSRDS-NBS-22, *Atomic Transition Probabilities. Vol. II. Sodium Through Calcium, A. Critical Data Compilation,* W. L. Wiese, M. W. Smith, and B. M. Miles (1969). AD696884**

NSRDS-NBS-23, *Partial Grotrian Diagrams of Astrophysical Interest,* C. E. Moore and P. W. Merrill (1968).**

NSRDS-NBS-24, *Theoretical Mean Activity Coefficients of Strong Electrolytes in Aqueous Solutions from 0 to 100 °C,* Walter J. Hamer (1968).*

NSRDS-NBS-25, *Electron Impact Excitation of Atoms,* B. L. Moiseiwitsch and S. J. Smith (1968).**

NSRDS-NBS-26, *Ionization Potentials, Appearance Potentials and Heats of Formation of Gaseous Positive Ions,* J. L. Franklin, J. G. Dillard, H. M. Rosenstock, J. T. Heron, K. Draxl, and F. H. Field (1969). SD Catalog No. C13.48:26. $6.20.

NSRDS-NBS-27, *Thermodynamic Properties of Argon from the Triple Point to 300 K at Pressures to 1000 Atmospheres,* A. L. Gosman, R. D. McCarty, and J. G. Hust (1969). SD Catalog No. C13.48:27. $1.80.

NSRDS-NBS-28, *Molten Salts: Vol. 2, Section 1. Electrochemistry of Molten Salts: Gibbs Free Energies and Excess Free Energies from Equilibrium-Type Cells,* G. J. Janz and C. G. M. Dijkhuis; *Section 2. Surface Tension Data,* G. J. Janz, G. R. Lakshminarayanan, R. P. T. Tomkins, and J. Wong (1969).**

NSRDS-NBS-29. *Photon Cross Sections, Attenuation Coefficients, and Energy Absorption Coefficients from 10 keV to 100 GeV,* J. H. Hubbell (1969). SD Catalog No. C13.48:29. $1.25.

NSRDS-NBS-30, *High Temperature Properties and Decomposition of Inorganic Salts, Part 2. Carbonates,* H. H. Stern and E. L. Weise (1969).**

NSRDS-NBS-31, *Bond Dissociation Energies in Simple Molecules,* B. deB. Darwent (1970). SD Catalog No. C13.48:31. $0.95.

NSRDS-NBS-32, *Phase Behavior in Binary and Multicomponent Systems at Elevated Pressures: Pentane and Methane-n-Pentane,* V. M. Berry and B. H. Sage (1970). SD Catalog No. C13.48:32. $1.15.

NSRDS-NBS-33, *Electrolytic Conductance and Conductances of the Halogen Acids in Water,* W. J. Hamer and H. J. DeWane (1970). PB192183**

NSRDS-NBS-34, *Ionization Potentials and Ionization Limits Derived from the Analyses of Optical Spectra,* C. E. Moore (1970). SD Catalog No. C13.48:34. $0.75.

NSRDS-NBS-35, *Atomic Energy Levels as Derived from the Analyses of Optical Spectra, Vol. I* ^{1}*H to* ^{23}*V; Vol. II.* ^{24}*Cr to* ^{41}*Nb; Vol. III.* ^{42}*Mo to* ^{57}*La,* ^{72}*Hf to* ^{89}*Ac,* C. E. Moore (1971). SD Catalog No. C13.48:35/Vol. I. $9.25; Vol. II. $7.95; Vol. III. $8.30.

NSRDS-NBS-36, *Critical Micelle Concentrations of Aqueous Surfactant Systems,* P. Mukerjee and K. J. Mysels (1971).COM71-50203**

NSRDS-NBS-37, *JANAF Thermochemical Tables, 2nd ed.,* D. R. Stull, H. Prophet, et al. (1971). SD Catalog No. C13.48:37. $15.60.

NSRDS-NBS-38, *Critical Review of Ultraviolet Photoabsorption Cross Sections for Molecules of Astrophysical and Aeronomic Interest,* R. D. Hudson (1971). SD Catalog No. C13.48:38. $1.50.

NSRDS-NBS-39, *Tables of Molecular Vibrational Frequencies, Consolidated Volume I,* T. Shimanouchi (1972). SD Catalog No. C13.48:39. $5.10.

NSRDS-NBS-40, *A Multiplet Table of Astrophysical Interest, Revised Edition, Part I. Table of Multiplets; Part II. Finding List of All Lines in the Table of Multiplets,* C. E. Moore (1972). COM72-50439**

NSRDS-NBS-41, *Crystal Structure Transformations in Binary Halides,* C. N. R. Rao and M. Natarajan (1972). COM72-50849**

NSRDS-NBS-42, *Selected Specific Rates of Reactions of the Solvated Electron in Alcohols,* E. Watson, Jr. and S. Roy (1972). SD Catalog No. C13.48:42. $0.60.

NSRDS-NBS-43, *Selected Specific Rates of Reactions of Transients from Water in Aqueous Solution. I. Hydrated Electron,* M. Anbar, M. Bambenek, and A. B. Ross (1972). SD Catalog No. C13.48:43. 1.05.

NSRDS-NBS-43, Suppl., *Selected Specific Rates of Reactions of Transients from Water in Aqueous Solution. Hydrated Electron, Supplemental Data,* Alberta B. Ross. SD Catalog No. C13.48:43/Suppl. $1.10.

NSRDS-NBS-44, *The Radiation Chemistry of Gaseous Ammonia,* D. B. Peterson (1974). COM74-50175**

NSRDS-NBS-45, *Radiation Chemistry of Nitrous Oxide Gas. Primary Processes, Elementary Reactions, and Yields,* G. R. A. Johnson (1973). SD Catalog No. C13.48:45. $0.60.

NSRDS-NBS-46, *Reactivity of the Hydroxyl Radical in Aqueous Solutions,* Leon M. Dorfman and Gerald E. Adams (1973). COM73-50623**

NSRDS-NBS-47, *Tables of Collision Integrals and Second Virial Coefficients for the (m,6,8) Intermolecular Potential Function,* Max Klein, H. J. M. Hanley, Francis J. Smith, and Paul Holland (1974). SD Catalog No. C13.48:47. $1.90.

NSRDS-NBS-48, *Radiation Chemistry of Ethanol: A Review of Data on Yields, Reaction Rate Parameters, and Spectral Properties of Transients,* Gordon A. Freeman (1974). SD Catalog No. C13.48:48. $0.80.

NSRDS-NBS-49, *Transition Metal Oxides, Crystal Chemistry, Phase Transition, and Related Aspects,* C. N. R. Rao and G. V. Subba Rao (1974). SD Catalog No. C13.48:49. $1.70.

NSRDS-NBS-50, *Resonances in Electron Impact on Atoms and Diatomic Molecules,* George J. Schulz (1973). AD77/200**

NSRDS-NBS-51, *Selected Specific Rates of Reactions of Transients from Water in Aqueous Solution. II. Hydrogen Atom,* Michael Anbar, Farhataziz, and A. B. Ross (1975). SD Catalog No. C13.48:51. $1.20.

NSRDS-NBS-52, *Electronic Absorption and Internal and External Vibrational Data of Atomic and Molecular Ions Doped in Alkali Halide Crystals,* S. C. Jain, A. V. R. Warrier, and S. K. Agarwal (1974). SD Catalog No. C13.48:52. $0.95.

NSRDS-NBS-53, *Crystal Structure Transformations in Inorganic Nitrites, Nitrates and Carbonates,* C. N. R. Rao, B. Prakash, and M. Natarajan. SD Catalog No. C13.48:53. $1.15.

NSRDS-NBS-54, *Radiolysis of Methanol: Product Yields, Rate Constants and Spectroscopic Parameteres of Intermediates,* J. H. Baxendale and Peter Wardman (1975). SD Catalog No. C13.48:54. $0.85.

NSRDS-NBS-55, *Property Index to NSRDS Data Compilations, 1964—1972,* David R. Lide, Jr., Gertrude B. Sherwood, Charles H. Douglass, Jr., and Herman M. Weisman. SD Catalog No. C13.48:55. $0.85.

NSRDS-NBS-56, *Crystal Structure Transformations in Inorganic Sulfates, Phosphates, Perchlorates, and Chromates,* B. Prakash and C. N. R. Rao. SD Catalog No. C13.48:56. $0.85.

NSRDS-NBS-57, *Yields of Free Ions Formed in Liquids by Radiation,* A. O. Allen (1976). SD Catalog No. C13.48:57. $0.55.

NSRDS-NBS-58, *Drift Mobilities and Conduction Band Energies of Excess Electrons in Dielectric Liquids,* A. O. Allen (1976). SD Catalog No. C13.48:58. $0.70.

NSRDS-NBS-59, *Selected Specific Rates of Reactions of Transients from Water in Aqueous Solution, III. Hydroxyl Radical and Perhydroxyl Radical and Their Radical Ions,* Farhataziz and Alberta B. Ross (1977). SD Catalog No. C13.48:59. $1.90.

NSRDS-NBS-60, *Atomic Energy Levels — The Rare Earth Elements, The Spectra of Lanthanum, Cerium, Praseodymium, Neodymium, Promethium, Samarium, Europium, Gadolinium, Terbium, Dysprosium, Holmium, Erbium, Thulium, Ytterbium, and Lutetium,* W. C. Martin, Romuald Zalubas, and Lucy Hagan (1977, in press). SD Catalog No. C13.48:60.

Publications giving SD Catalog Number may be ordered from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, using the SD Catalog Numbers given.

* Available from the Office of Standard Reference Data, National Bureau of Standards, Washington, D.C. 20234.

** Available from the National Technical Information Service, U.S. Department of Commerce, Springfield, VA 22151.

Publications of the Berkeley Particle Data Group

UCRL-20000 YN, *A compilation of YN Reactions,* Particle Data Group (1970).

UCRL-20000 NN, *NN and ND Interactions (above 0.5 GeV/c) — A Compilation,* Particle Data Group (1970).

UCRL-20030 *$\pi N, \pi N$ Partial-Wave Amplitudes,* Particle Data Group (1970).

LBL-53, *$\pi + p$, $\pi + n$, and $\pi + d$ Interactions — A Compilation; Parts I and II,* Particle Data Group (1973).

LBL-55, *K°,N Interactions — A Compilation,* Particle Data Group (1972).

LBL-58, *NN and ND Interactions — A Compilation,* Particle Data Group (1972).

LBL-63, *πN Two-Body Scattering Data I. A. User's Guide to the Lovelace-Almehed Data Tape,* Particle Data Group (1973).

LBL-100, *Review of Particle Properties,* Particle Data Group (1976).

Other NSRDS Data Publications

Crystal Data, Determinative Tables, 3rd ed., Vol. 1. Organic Compounds, J. D. H. Donnay and Helen M. Ondik (1972). Published jointly by the U.S. Department Commerce — National Bureau of Standards and the Joint Committee on Powder Diffraction Standards. $30.00.

Crystal Data, Determinative Tables, 3rd ed., Vol. 2. Inorganic Compounds, J. D. H. Donnay and Helen M. Ondick (1973). Published jointly by the U.S. Department of Commerce — National Bureau of Standards and the Joint Committee on Powder Diffraction Standards. $50.00.

Available from the Joint Committee on Powder Diffraction Standards, 1610 Park Lane, Swarthmore, PA 19081.

Selected Thermodynamic Values and Phase Diagrams for Copper and Some of Its Binary Alloys, R. Hultgren and P. D. Desai (1973). Published by the International Copper Research Association, Inc., New York (Monograph I). $10.00.

Selected Values of the Thermodynamic Properties of Binary Alloys, R. Hultgren, P. D. Desai, D. T. Hawkins, M. Gleiser, and K. K. Kelley (1973). Published by the American Society for Metals, Metals Park, Ohio. $30.00.

Selected Values of the Thermodynamic Properties of the Elements, R. Hultgren, P. D. Desai, D. T. Hawkins, M. Gleiser, K. K. Kelley, and D. D. Wagman (1973). Published by the American Society for Metals, Metals Park, Ohio. $20.00.

Thermodynamic Properties of Copper and Its Inorganic Compounds, E. G. King, Alla D. Mah, and L. B. Pankratz (1973). Published by the International Copper Research Association, Inc. , New York. (Monograph II). $10.00.

Ion-Molecule Reactions, E. W. McDaniel, V. Cermak, A. Dalgarno, E. E. Ferguson, and L. Friedman (1970). Published by Wiley-Interscience Series in Atomic and Molecular Collisional Processes. $21.50.

Theory of Charge Exchange, R. A. Mapleton (1971). Published by Wiley-Interscience Series in Atomic and Molecular Collisional Processes. $19.95.

Dissociation in Heavy Particle Collisions, G. W. McClure and J. M. Peek (1972). Published by Wiley-Interscience Series in Atomic and Molecular Collisional Processes. $13.95.

Excitation in Heavy Particle Collisions, E. W. Thomas (1972). Published by Wiley-Interscience Series in Atomic and Molecular Collisional Processes. $22.50.

Total electron-atom collision cross sections at low energies, — a critical review, Benjamin Bederson, L. J. Kieffer, *Rev. Mod. Phys.,* 43(4), 601, 1971.

Electron impact ionization cross-section data for atoms, atomic ions, and diatomic molecules: I. Experimental data, L. J. Kieffer, G. H. Dunn, *Rev. Mod. Phys.,* 38(1), 1966.

Theory of the ionization of atoms by electron impact, M. R. H. Rudge, *Rev. Mod. Phys.,* 40(3), 564, 1968.

Coblentz Society Evaluated Infrared Reference Spectra, Edited and published by the Coblentz Society, sponsored by the Joint Committee on Atomic and Molecular Physical Data (1969—1974). Available from Sadtler Research Laboratories, Philadelphia, PA 19104. (Microfilm available from the Coblentz Society.)

Vol. 6, 1000 Spectra $295.00
Vol. 7, 1000 Spectra $295.00
Vol. 8, 1000 Spectra $295.00
Vol. 9, 1000 Spectra $295.00
Vol. 10, 1000 Spectra $295.00
Cumulative Coblentz Indexes $50.00

Contributions to the Data on Theoretical Metallurgy: XVI. Thermodynamic Properties of Nickel and Its Inorganic Compounds, Alla D. Mah and L. B. Pankratz (1976) U.S. Bureau of Mines Bulletin 668. SD Catalog No. I28.3.668. $2.70.

Thermodynamic Properties of Aqueous Copper Systems, Paul Duby (1977, in press). To be published by the International Copper Research Association, Inc., New York (Monograph III).

Translations from the Russian

A number of products of the Russian standard reference data system have been translated by the Israel Translation Service with the support of the National Science Foundation at the request of the National Bureau of Standards. These Russian translations are available from NTIS. Send inquiries on prices and orders to National Technical Information Service, Springfield, VA 22151.

Thermodynamic and Thermophysical Properties of Combustion Products, Volume I, Computation Methods, V. E. Alemasov, A. F. Dregalin, A. P. Tishin, and V. A. Khudyakov; V. P. Glushko, Ed. (1971). Original published by the Academy of Sciences of the USSR. TT74-50019, 1974, xx + 433 pp.

Thermodynamic and Thermophysical Properties of Combustion Products, Volume II. Oxygen Based Propellants, V. E. Alemasov, A. F. Dregalin, V. A. Khudyakov and V. M. Kostin; V. P. Glushko, Ed. (1972). Original published by the Academy of Sciences of the USSR. TT74-50032, x + 495 pp.

Thermodynamic and Thermophysical Properties of Combustion Products, Volume III. Oxygen- and Air-Based Propellants, V. E. Alemasov, A. F. Dregalin, A. P. Tishin, V. A. Khudyakov and V. M. Kostin; V. P. Glushko, Ed. (1973). Original published by the Academy of Sciences of the USSR. TT75-50007, 1975, x + 622 pp.

Thermodynamic and Thermophysical Properties of Combustion Products, Volume IV. Nitrogen Tetroxide-Based Propellants, V. E. Alemasov, A. F. Dregalin, A. P. Tishin, V. A. Khudyakov, and V. N. Kostin; V. P. Glushko, Ed. (1973). Original published by the Academy of Sciences of the USSR. TT76-50007, 1976, x + 530 pp.

Properties of Liquid and Solid Hydrogen, B. N. Esel'son, Yu. P. Blagoi, V. N. Grigor'ev, V. G. Manzhelii, S. A. Mikhailenko, and N. P. Neklyudov (1969). Original published by the Committee of Standards, Measures and Measuring Instruments of the USSR Council of Ministers — Government Standards Service. TT70-50179, 1974, iii + 123 pp.

Electric Conductivity of Ferroelectrics, V. M. Gurevich (1969). Original published by the Committee of Standards, Measures and Measuring Instruments of the USSR Council of Ministers — Government Standards Service. TT70-50180, 1971, vi + 362 pp.

Handbook of Hardness Data, A. A. Ivank' ko; G. V. Samsonov, Ed. (1968). Original published by the Academy of Sciences of the Ukrainian SSR, Institute of Materials Sciences. TT70-50177, 1971, iii + 66 pp.

Heavy Water, Thermophysical Properties, Ya. Z. Kazavchinskii et al.; V. A. Kirillin, Ed. (1963). TT70-50094, 1971, vii + 263 pp., 2 charts.

Thermophysical Properties of Freon-22, A. V. Kletskii (1970). Original published by the Committee of Standards, Measures and Measuring Instruments of the USSR Council of Ministers — Government Standards Service. TT70-50178, 1971, iv + 67 pp., 1 chart.

Rate Constants of Gas Phase Reactions, Reference Book, V. N. Kondratiev (1970). Original published by the Academy of Sciences of the USSR Order-of-Lenin Institute of Chemical Physics. Translated by L. Holtschlad and R. Fristrom. COM-72-10014, 1972, vi + 428 pp.

*Thermophysical Properties of Gases and Liquids, No. 1,*V. A. Rabinovich (1968). Original published by the Committee of Standards, Measures and Measuring Instruments of the USSR Council of Ministers — Government Standards Service, Series: Physical Constants and Properties of Substances. TT69-55091. 1970, viii + 207 pp.

Handbook of Phase Diagrams of Silicate Systems, Vol. I. Binary Systems, Second Revised Edition, N. A. Toropov, V. P. Barzakovskii, V. V. Lapin, and N. N. Kurtseva; N. A. Toropov, Ed. (1969). Original published by the Academy of Sciences of the USSR Grebenschikov Institute of Silicate Chemistry. TT71-50040, 1972, viii + 723 pp.

Handbook of Phase Diagrams of Silicate Systems. Vol. II. Metal-Oxygen Compounds in Silicate Systems, Second Revised Edition, N. A. Toropov, V. P. Barzakovskii, I. A. Bondar', and Yu. P. Udalov; N. A. Toropov, Ed. Original published by the Academy of Sciences of the USSR Grebenschikov Institute of Silicate Chemistry. TT71-50041, 1972, iv + 325 pp.

Thermodynamic and Thermophysical Properties of Helium, N. V. Tsederberg, V. N. Popov, and N. A. Morozova; A. F. Alyab'ev, Ed. (1969). Original published by Atomizdat. TT70-50096, 1971, v + 255 pp.

Thermophysical Properties of Air and Air Components, A. A. Vasserman, Ya. A. Kazavchinskii, and V. A. Rabinovich; A. M. Zhuravlev, Ed. (1966). Original published by the Academy of Sciences of the USSR. TT70-50095, 1971, x + 383 pp., 8 charts.

Thermophysical Properties of Liquid Air and Its Components, A. A. Vasserman and V. A. Rabinovitch (1968). Original published by the Committee of Standards, Measures and Measuring Instruments of the USSR Council of Ministers — Government Standards Service. TT69-55092, 1970, viii + 235 pp., 2 charts.

Thermophysical Properties of Gaseous and Liquid Methane, V. A. Zagoruchenko and A. M. Zhuravlev (1969). Original published by the Committee of Standards, Measures and Measuring Instruments of the USSR Council of Ministers — Government Standards Service. TT70-50097, 1970, viii + 243 pp.

Surface Ionization, E. Ya. Zandberg and N. L. Ionov (1969). Original published by the Science Publishing House. Translated by E. Harnik. TT70-50148, 1971, xii + 355 pp.

Thermodynamic and Transport Properties of Ethylene and Propylene, I. A. Neduzhii et al. (1971). Original published by the State Committee of Standards of the Soviet Ministry, USSR, State Office of Standards and Reference Data Series: Monograph No. 8. Translation published June 1972. NBSIR 75-763.

Other NBS Compilations of Data

NBS Tech. Note 270-3,*Selected Values of Chemical Thermodynamic Properties, Tables for the First Thirty-Four Elements in the Standard Order of Arrangement,* D. D. Wagman, W. H. Evans, V. B. Parker, I. Halow, S. M. Bailey, and R. H. Schumm (1968). SD Catalog No. C13.46:270-3. $2.75.

NBS Tech. Note 270-4,*Selected Values of Chemical Thermodynamic Properties, Tables for Elements 35 through 53 in the Standard Order of Arrangement,* D. D. Wagman, W. H. Evans, V. B. Parker, I. Halow, S. M. Bailey, and R. H. Schumm (1969). SD Catalog No. C13.46:270-4. $2.10.

NBS Tech. Note 270-5,*Selected Values of Chemical Thermodynamic Properties, Tables for Elements 54 through 61 in the Standard Order of Arrangement,* D. D. Wagman, W. H. Evans, et al. (1971). SD Catalog No. C13.46:270-5. $0.95.

NBS Tech. Note 270-6, Selected Values of Chemical Thermodynamic Properties, Tables for the Alkaline Earth Elements (Elements 92 through 97 in the Standard Order of Arrangement), *V. B. Parker, D. D. Wagman, and W. H. Evans (1971). SD Catalog No. C13.46:270-6. $1.55.*NBS Tech. Note 270-7,*Selected Values of Chemical Thermodynamic Properties, Tables for the Lanthanide (Rare Earth) Elements (Elements 62 through 76 in the Standard Order Of Arrangement),* R. H. Schumm, D. D. Wagman, S. Bailey, W. H. Evans, and V. B. Parker (1973). SD Catalog No. C13.46:270-7. $1.25.

NBS Tech. Note 438,*Compendium of ab-initio Calculations of Molecular Energies and Properties,* M. Krauss (1967). AD665245.*

NBS Tech. Note 474,*Critically Evaluated Transition Probabilities for Ba I and II,* B. M. Miles and W. L. Wiese (1969). AD681-351*

NBS Tech Note 484, *A Review of Rate Constants of Selected Reactions of Interest in Re-Entry Flow Fields in the Atmosphere,* M. H. Bortner (1969).AD692-231*

NBS Tech. Note 866, *Chemical Kinetic and Photochemical Data for Modelling Atmospheric Chemistry,* Robert F. Hampson, Jr. and David Garvin, Eds. (1975). SD Catalog No. C13.46:866. $1.85.

NBS Tech. Note 928, *Computer Programs for the Evaluation of Activity and Osmotic Coefficients,* Bert R. Staples and Ralph L. Nuttall (1976). SD Catalog No. C13.46:928. $1.10.

NBS Monograph 70. Vol. I.*Microwave Spectral Tables, Diatomic Molecules,* P. F. Wacker, M. Mizushima, J. D. Petersen, and J. R. Ballard (1964). PB168072.*

NBS Monograph 70. Vol. II.*Microwave Spectral Tables, Line Strengths of Asymmetric Rotors,* P. F. Wacker and M. R. Pratto (1964). PB189714.*

NBS Monograph 70. Vol. III.*Microwave Spectral Tables, Polyatomic Molecules with Internal Rotation,* P. F. Wacker, M. S. Cord, D. G. Burkhard, J. D. Petersen, and R. F. Kukol (1969). COM-74-10794.*

NBS Monograph 70. Vol. IV.*Microwave Spectral Tables Polyatomic Molecules without Internal Rotation,* M. S. Cord, J. D. Petersen, M. S. Lojko, and R. H. Haas (1968). COM-74-10795.*

NBS Monograph 70. Vol. V.*Microwave Spectral Tables, Spectral Line Listing,* M. S. Cord, M. S. Lojko, and J. D. Petersen (1968). COM-74-10796.*

NBS Monograph 94.*Thermodynamic and Related Properties of Parahydrogen from the Triple Point to 100 K at Pressures to 340 Atmospheres,* H. M. Roder, L. A. Weber, and R. D. Goodwin (1965). N65-32001.*

NBS Monograph 115.*The Calculation of Rotational Energy Levels and Rotational Line Intensities in Diatomic Molecules,* Jon T. Hougen (1970). RB192-874.*

NBS Monograph 134, *Space Groups and Lattice Complexes,* Werner Fisher, Hans Burzlaff, Erwin Hellner, and J. D. H. Donnay (1973). COM-73-50582*

NBS Monograph 153,*The First Spectrum of Hafnium (HF I).* William F. Meggers and Charlotte E. Moore (1976). SD Catalog No. C13.44:153. $1.35.

*Compilation of Low Energy Electron Collision Cross Section Data. Part I.*L. J. Kieffer, JILA Information Center Report No. 6 (1969). PB189127.*

Compilation of Low Energy Electron Collision Cross Section Data. Part II. L. J. Kieffer, JILA Information Center Report No. 7 (1969). AD696467.*

Low Energy Electron-Collision Cross Section Data. Part III: Total Scattering; Differential Elastic Scattering, Atomic Data, L. J. Kieffer, Vol. 2, No. 4, 293—391 (1971).

Compilation of Electron Collision Cross Section Data for Modeling Gas Discharge Lasers, L. J. Kieffer, JILA Information Center Report No. 13 (1973). COM-74-11661.*

Derived Thermodynamic Properties of Ethylene, Roland H. Harrison and Donald R. Douslin, *J. Chem. Eng. Data,* 22(1), 24—30 (Jan. 1977).

Pressure, Volume, Temperature Relations of Ethylene, D.

R. Douslin and R. H. Harrison, *J. Chem. Thermodyn.*, 76(8), 301—330 (Aug. 1976).

* Available from the National Technical Information Service, Springfield, VA 22151.

NBS Spec. Publ. 449, *Chemical Kinetics of the Gas Phase Combustion of Fuels (A Bibliography on the Rates and Mechanisms of the Oxidation of Aliphatic C_1-C_{10} Hydrocarbons and of Their Oxygenated Derivatives)*, Francis Westley (1976). SD Catalog No. C13.10:449. $2.00.

NBS Spec. Publ. 454, *An Annotated Bibliography of Sources of Compiled Thermodynamic Data Relevant to Biochemical and Aqueous Systems (1930 — 1975) Equilibrium, Enthalpy, Heat Capacity, and Entropy Data*, George T.Armstrong and Robert N. Goldberg, (1976). SD Catalog No. C13.10:454. $1.65.

NBS Spec. Publ. 463, *Materials Information Programs, An Interagency Review of Federal Agency Activities on Technical Information about Materials, Proceedings of* *a Conference held at the National Bureau of Standards, Gaithersburg, Maryland, April 16 and 17, 1974,* S. A. Rossmassler, Ed. (1977). SD Catalog No. C13.10:463. $3.35.

NBS Tech. Note 291, *A Bibliography on Ion-Molecule Reactions, January 1900 to March 1966,* F. N. Harllee, H. M. Rosenstock, and J. T. Herron (1966). SD Catalog No. C13.46:291. $0.75.

NBS Tech. Note 464, *The NBS Alloy Data Center: Function, Bibliographic System, Related Data Centers, and Reference Books,* G. C. Carter, L. H. Bennett, J. R. Cuthill, and D. J. Kahan (1968).*

NBS Tech. Note 554, *Annotated Accession List of Data Compilations of the NBS Office of Standard Reference Data,* H. M. Weisman and G. B. Sherwood (1970). SD Catalog No. C13.46:554. $2.20.

NBS Tech. Note 848, *A Bibliography of the Russian Reference Data Holdings of the Library of the Office of Standard Reference Data,* Gertrude B. Sherwood and Howard J. White, Jr. (1974). SD Catalog No. C13.46:848. $0.55.

NBS Tech. Note 881, *Critical Evaluation of Data in the Physical Sciences — A Status Report on the National Standard Reference Data System, April 1975,* Stephen A. Rossmassler, Ed. (1975). SD Catalog No. C13.46:881. $1.10.

NBS Tech. Note_, *Critical Evaluation of Data in the Physical Sciences — A Status Report on the National Standard Reference Data System, January 1977,* Stephen A. Rossmassler, Ed. (1977, in press). SD Catalog No. C13.46:_, in press.

A Compilation of Volumes I—IV of Bibliography on High Pressure Research with Author and Subject Indexes, Volumes I and II, J. F. Cannon and L. Merrill (1972). Published by and available from the High Pressure Data Center, Brigham Young University, Provo, UT 84601.

Binary Fluorides, Free Molecular Structures and Force Fields, A Bibliography (1957—1975), D. T. Hawkins, L. S. Bernstein, W. E. Falconer, and W. Klemperer, IFI/Plenum, New York (1976).

Bulletin of Chemical Thermodynamics, IUPAC Commission on Thermodynamics and Thermochemistry, Robert D. Freeman, Ed., former title: Bulletin of Thermodynamics and Thermochemistry. Volume 20, 1977, $20.00.

Subscriptions and orders for single copies and back issues should be addressed to:
Bulletin of Chemical Thermodynamics
Department of Chemistry
Oklahoma State University
Stillwater, OK 74074 USA
Checks should be made payable, in U.S. funds, to:
Bulletin of Chemical Thermodynamics

* Available from National Technical Information Service, Springfield, VA 22151; use PB, AD, or COM number when given or use the series number.

** Available from J. Fuhr, National Bureau of Standards, Phys. Bldg. Room A267, Washington, D.C. 20234.

The Coblentz Society Specifications for Evaluation of Research Quality Analytical Infrared Spectra (Class II), Coblentz Society Board of Managers, *Anal. Chem.,* 47(11) 945—952, 1975.

The Compilation and Evaluation of Chemical Kinetics Data; A Descriptive Survey of Current Efforts, Lewis H. Gevantman and David Garvin, *Int. J. Chem. Kinet.,* 213—230, 1973.

A Compilation of Volumes I—IV of Bibliography on High Pressure Research with Author and Subject Indexes, Volumes I and II, J. F. Cannon and L. Merrill (1972). Published by and available from the High Pressure Data Center, Brigham Young University, Provo, UT 84601.

Cooperation Between Professional Societies and A Government Agency: The Journal of Physical and Chemical Reference Data, David R. Lide, Jr. *IEEE Transactions on Professional Communications PC-18* (3) 127—129 (Sept. 1975).

Equilibrium Properties of Fluid Mixtures, A Bibliography on Fluids of Cryogenic Interest, M. J. Hiza, A. J. Kidnay, and R. C. Miller, IFI/Plenum, New York (1975).

Guide for the Presentation in the Primary Literature of Numerical Data Derived from Experiment, Report of the CODATA Task Group on Publication of Data in the Primary Literature, September 1973, Unesco-UNISIST Guide, Verbatim publication also in *CODATA Bulletin,* 9, December 1973, *NSRDS News,* February 1974.

Liquid Vapor Equilibria on Systems of Interest in Cryogenics, A Survey, A. J. Kidnay, M. J. Hiza, and R. C. Miller, *Cryogenics,*13(10), 575—599, 1973.

The Presentation of Chemical Kinetics Data in the Primary Literature, CODATA Task Group on Data for Chemical Kinetics, S. W. Benson, Chairman, *CODATA Bulletin,*13 (December 1974).

Recommendations for Data Compilations and for the Reporting of Measurements of the Thermal Conductivity of Gases, H. M. Hanley, et al., J. Heat Transfer, 93(4), 479—480, 1971.

Recommendations for the Presentation of NMR Data for Publication in Chemical Journals, IUPAC Commission I.5 on Molecular Structure and Spectroscopy, R. N. Jones, Chairman, *Pure Appl. Chem.,* 29, (4), 627—628, 1972.

Survey of Analytical Spectral Data Sources and Related Data Compilation Activities, Lewis H. Gevantman, *Anal. Chem.,* 44(7), 30—48, 1972.

INDEX

A

AB, definition, F-90
Abbreviations
  chemistry and physics, common usage, F-284
  inorganic compounds table, as used in, B-50
  minerals table, as used in, B-180
  organic compounds table, as used in, C-80
  scientific and engineering terms, American Standard, F-304—306
  weight and measure, common units, F-306
Abcoulomb, definition, F-90
Aberration, chromatic, definition, F-96
Aberration, constant of
  definition, F-98
  value, F-192
Aberration, definition, F-90
Aberration, planetary, definition, F-121
Aberration, spherical, definition, F-127
Aberrations (of image), definition, F-90
Absolute humidity, see Humidity, absolute
Absolute pressure, definition, F-122
Absolute scale of temperature, see Kelvin scale
Absolute temperature, definition, F-90, 128
Absolute units, definition, F-90
Absolute viscosity, units, conversion tables, F-49—50
Absolute viscosity, water at 20°C, F-49
Absolute zero, definition, F-90
Absorbent oxygen, prepration of, D-135
Absorptance
  defining equation for, E-216
  symbol and unit for, E-216
Absorption, coefficient of, see also Absorption factor
  definition and formula, F-90
  paints and metals, for solar radiation, E-230
Absorption, definition, F-90
Absorption, Lambert's law, definition and formula, F-90
Absorption, sound, see Sound, absorption
Absorption coefficient, definition and equation, F-90
Absorption cross sections, definition, F-90
Absorption factor, definition and formula, F-90
Absorption number, definition, F-341
Absorption spectrum, definition, F-90
Absorptive index, definition, F-90
Absorptive power, definition, F-90
Absorptivity, see Absorptive power
Abundance, % natural, of isotopes, B-237—320, E-70—72
Abvolt, definition, F-90
Acceleration, Coriolis,
  definition, F-98
Acceleration, definition F-90
Acceleration due to gravity, definition, F-90
Acceleration due to gravity and length of the seconds pendulum, F-200
Acceleration due to gravity at any latitude and elevation, equation, F-90
Acceleration number, definition, F-334
Acceleration of free fall, standard, defined value, F-329
Acceleration of gravity vs. altitude, graph, F-211
Accelerators, definition, F-90
Acceptor, definition, F-90
Acetates, lattice energy, D-89
Acetic acid, see also Organic compounds
  concentrative properties of, in varying concentration, D-229
Acetone, see also Organic compounds
  concentrative properties of, in varying concentration, D-229—230
Acetylides, lattice energy, D-89
Achromatic, definition, F-90
Acid, definition, F-91
Acid base indicators preparation, color change, pH range, D-150—151
Acid value of waxes, C-769
Acidity, values, see pH
Acids, see also Inorganic compounds, Organic compounds, Amino acids
  dilution, heat of, table, D-117—118
  heat capacity, table, D-119
  naming of inorganic, B-37—39
  oxo
    naming of, B-37—38
    table of, B-38
Acoustics, absorption coefficient,
  definition, F-90
Acoustics, symbols used, F-294
Acoustic velocity, definition, F-91
Actinic, definition, F-91
Actinide series, definition, F-91
Actinium (Ac 89)
  atomic number, B-1, 3
  atomic weight, B-3
  boiling point, B-3
  electronic configuration, B-1
  history, B-3
  line spectra of, E-218
  melting point, B-3
  production, general methods, B-3
  properties in general, B-3
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-3
  symbol, B-1, 3
  uses, B-3
Actinometer, definition, F-91
Action, definition, F-91
Active mass, definition, F-91
Activity coefficient
  acids, bases, and salts, D-169
  definition, F-91
Acyclic hydrocarbons, nomenclature rules, C-1—8
Adiabatic atmosphere, definition
  and equation, F-91
Adiabatic, definition, F-91
Adiabatic process,
  definition, F-91
Adrenal corticosteroids
  formulae, chemical, C-741—746

    properties, C-741—746
    uses, C-740
  Adsorption, definition, F-91
  Advance ratio, definition, F-341
  Aeroelasticity parameter, definition, F-341
  Air
    enthalpy, table of values, F-13—15
    index of refraction (15°C, 76 cm Hg), table, E-381
    isentropic exponent, table of values, F-13—15
    mass attenuation coefficients, E-146
    molecular weight, table of values, F-13—15
    Prandtl number, table of values, F-13—15
    specific heat, table of values, F-13—15
    thermal conductivity, table of values, F-13—15
    thermodynamic properties at 20, 30 and 40 Atm., F-13—15
    transport properties at 20, 30 and 40 Atm., F-13—15
    viscosity, table of values, F-13—15
  Air, atmospheric, components of, F-211
  Air, dry
    density, calculation, of F-9, 11
    density, tables of values, F-9, 11
  Air, moist
    density, calculation, tables of factors for, F-9
    density, table of values, 5°C to 35°C, F-10
  Air columns, frequency of vibration in, see Organ pipes
  Albedo, planets and their satellites, F-181
  Alcohol, see also Organic compounds
    ethyl
      density, table, F-3
      surface tension in water, table, F-45
    methyl, surface tension in water, F-44
  Alcoholmeter, scale units, F-3
  Aldaric acids, natural, see Carbohydrates
  Alditols, natural, see Carbohydrates
  Aldonic acids, natural, see Carbohydrates
  Aldoses, see Carbohydrates
  Alfvén number, definition, F-334
  Alfvén speed,
    definition, F-91
  Alfvén wave, definition
    and equation, F-91
  Algebraic forms, miscellaneous, integrals, A-63—65
  Alkalinity, values, see pH
  Allobar, definition, F-91
  Allotropy, definition, F-91
  Alloys
    commercial magnetic
      coercive force, E-117—118, 122—123
      composition, % by wt, E-117—120, 122—123
      country of manufacture, E-117—120
      density, E-122
      energy product, maximum, E-117—118, 123
      magnetizing force, E-123
      permeability, E-122
      remanence, E-117—118
      resistivity, E-122
      saturation flux density, E-122
      specific gravity, E-118—120
      tensile strength, E-118—120
      thermal expansion, E-119—120
      uses, E-118-120
    glass sealing and lead wire materials, composition and physical properties, F-160—161
    low melting point, composition of, F-24
    mixtures of metals, melting points, D-186
    sodium-potassium alloys, physical properties, F-83—84
    solders, properties, tables, F-172—174
    steel, composition standard types of stainless and heat resisting, F-157—158
      wires, resistance of, tables for several metals, F-168—170
  Alpha (α)-particle, definition, F-91
  Alpha-ray, see Alpha particle
  Alternating current, definition and equations, F-91
  Altitude
    geometric and geopotential, relationship, F-205
    variation of physical properties with change, graphs, F-209—211
  Altitudes with the barometer, formulae, F-91
  Aluminon (solution), preparation of, D-132
  Aluminum (Al 13)
    atomic number, B-1, 3
    atomic weight, B-3
    boiling point, B-3
    electronic configuration, B-1
    gravimetric factors, logs of, B-145
    history, B-3
    line spectra of, E-218—219
    melting point, B-3
    production, general methods, B-3
    properties, in general, B-3
    properties, specific, see under Elements, Inorganic compounds, Metals
    specific gravity, B-3
    symbol, B-1, 3
    transition probabilities, E-352
    uses, B-3
    valence, B-3
    wire, cross-section and mass, F-167—168
    wire table, F-166
  Americium (Am 95)
    atomic number, B-1, 3
    atomic weight, B-3
    boiling point, B-3
    electronic configuration, B-1
    history, B-3
    line spectra of, E-219—220
    melting point, B-3
    price, approximate, B-4
    production, general methods, B-4
    properties in general, B-3—4
    properties, specific, see Elements, Inorganic compounds
    specific gravity, B-3
    symbol, B-1, 3
    uses, B-4
    valence, B-3
  Amino acids, see also Organic compounds
    density of crystallines, C-760
    ionization constants in various solvents, C-757—760
    pH values, table, C-757
    solubilities in various solvents, C-759—760
    specific rotation, table, C-758
  Amino sugars, see Carbohydrates

  properties, specific, see under Elements, Inorganic compounds
  symbol, B-1, 4
  uses, B-4
  valence, B-4
Asteroids, physical data of some, F-176—187
Astigmatism, definition, F-93
Astronomical unit, definition, F-93
ASTM, specifications and test methods, applicable to commercial plastics, C-781—790
Atmosphere
  air, components of, F-211
  composition for a dry atmosphere at sea level, F-206
  Earth, data, F-197
  Earth's, properties of, F-204
  homogeneous, definition, F-110
  ICAO standard, values, F-206, 208
  mass, total of Earth's, F-204
  normal, definition and equations, F-118
  planets and their satellites, composition, F-181
  sea level values of, ICAO, F-206
  standard, data tables, F-204—211
  standard, definition, F-93
  standard, graphical presentation of properties vs. altitude, F-209—211
  standard, nature of ions in unpolluted air, F-207
Atmospheric electricity, description and parameters, F-212
Atmospheric pressure, normal, defined value, F-329
Atmospheric radiation, definition, F-93
Atom, definition, F-93
Atomic and Molecular Processes Information Center, publications, F-369
Atomic bomb, definition, F-93
Atomic energy, definition, F-93
Atomic frequency standard,
  definition, F-108
Atomic heat, tungsten, table, E-394
Atomic mass, see also Atomic weight
Atomic mass, definition, F-93
Atomic mass unit,
  definition, F-93
Atomic mass unit, unified, definition, F-329
Atomic mass unit, value, F-244
Atomic number, definition, F-93
Atomic rotary power, definition, F-125
Atomic species, transition probabilities, E-352—378
Atomic structure, definition, F-93
Atomic theory, definition, F-93
Atomic transition probabilities, E-350—378
Atomic weight
  definition, F-93
  isotopes, table, E-70—72
Atoms
  electron affinities, E-67
  heats of formation, gaseous atoms from elements, F-244
Attenuation coefficient,
  definition and equations, F-93
ATTO, definition, F-93
Attraction, interionic,
  definition, F-112
Avogadro constant, value, F-244
Avogadro's law, definition, F-93
Avogadro's number, definition, F-93
Avogadro's principle, F-93
Azeotropes
  boiling point
    binary systems, tables, D-1—36
    ternary systems, tables, D-36—44
  percent composition
    binary systems, tables, D-1—36
    ternary systems, tables, D-36—44
  relative volume of layers
    binary system, tables, D-1—36
    ternary systems, tables, D-36—44

  - specific gravity
    - binary system, tables, D-1—36
    - ternary systems, tables, D-36—44
- Azide, lattice energy, D-89
- Azimuth, definition, F-93

B

- Babo's law, F-94
- Bagnold number, definition, F-334
- Bairstow number, definition, F-341
- Balance, sensitiveness, equation, F-125
- Balance with unequal arms, equation, F-117
- Bailing saccharometer, scale units, F-3
- Balmer series of spectral lines, equation, F-94
- Bang's reagent, preparation of, D-132
- Bansen number, definition, F-334
- Bar, definition, F-94
- Barfoed's reagent, preparation of, D-132
- Barium (Ba 56)
  - atomic number, B-1, 4
  - atomic weight, B-4
  - boiling point, B-4
  - electronic configuration, B-1
  - gravimetric factors, logs of, B-148
  - history, B-4
  - line spectra of, E-222—223

  base, definition, F-94
Brownian movement, F-95
Brucker's reagent, preparation of, D-133
Buckets, conversion factors for, F-309
Buffer solutions
  properties of standard aqueous, at 25°C, D-147
  standard values of pH at 0—95°C, D-148—149
  yielding round values of pH, D-148
Building materials, thermal conductivity of, E-5
Bulk modulus, equation, F-95
Bulygin number, definition, F-334
Bunsens ice calorimeter for specific heat, equation, F-127
Buoyancy parameter, definition, F-341
Butts, conversion factors for, F-309

C

Cable lengths, conversion factors for, F-309
Cadmium (Cd 48)
  atomic number, B-1, 6
  atomic weight, B-6
  boiling point, B-6
  electronic configuration, B-1
  gravimetric factors, logs of, B-150
  history, B-6
  line spectra of, E-227—228
  melting point, B-6
  price, approximate, B-6
  production, general methods, B-6
  properties in general, B-6
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-6
  symbol, B-1, 6
  toxicity, B-6
  uses, B-6
  valence, B-6
Cadmium chloride, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-232
Cadmium sulfate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-232
Calcium (Ca 20)
  atomic number, B-1, 6
  atomic weight, B-6
  boiling point, B-6
  electronic configuration, B-1
  gravimetric factors, logs of, B-150—151
  history, B-6
  line spectra of, E-228—229
  melting point, B-6
  production, general methods, B-6
  properties in general, B-6
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-6
  symbol, B-1, 6
  transition probabilities, E-356—357
  uses, B-6
  valence, B-6
Calcium carbonate, see also Inorganic compounds, Minerals
  dissociation pressure, table 550 to 1241°C, F-89
Calcium chloride, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-233
Calculus
  derivatives, table, A-32—35
  integrals, table, A-41—99
  integration, techniques, A-36—40
  matrix, recommended symbols in physics, F-298
  vector, recommended symbols in physics, F-298

Calibration
  spectroscope, wavelengths of various light sources, E-214
  volumetric glassware, E-368
Californium (Cf 98)
  atomic number, B-1, 6
  atomic weight, B-6
  electronic configuration, B-1
  history, B-6
  line spectra of, E-229—230
  production, general methods, B-6
  properties in general, B-6
  properties, specific, see under Elements, Inorganic compounds
  symbol, B-1, 6
  uses, B-6
Calorie
  conversion factors, F-309—310
  definitions for mean, normal and small, F-109—110
  factors for the conversion of ($\log_{10} x$) to ($RT \log_e x$), F-329
  general definition, F-95
  international steam table, defined value, F-329
  thermochemical, definition, F-329
Calutron, definition, F-95
Candela, definition, F-95
Candle (luminous intensity unit), see Candela
Candle (new unit), definition, F-96
Candle flame, luminance, E-213
Candle-power
  mean horizontal, definition, F-115
  mean spherical, definition, F-115
Capacitance, definition and equations, F-96
Capacitance, fair-weather atmosphere, F-212
Capillary constant, equation, F-96
Capillary number, definition, F-334
Carats, conversion factors for, F-309
Carbohydrates, see also Organic compounds

  minerals, table, C-81—548
  plastics, commercial, table, C-781—791
Color temperature of tungsten, table, E-394
Colorimetry
  standard coordinate system, E-411
  standard illuminants, E-411
  standard observer, determination of, E-411
Columbium, see Niobium
Coma, definition, F-97
Combination frequencies, definition, F-97
Combining volumes, definition, F-97
Combining weight, see also Equivalent weight definition, F-97
Combining weights, law of, F-97
Combustion, heat of, see Heat of combustion
Commercial alloys
  coefficient of linear expansion, D-187—188
  electrical resistivity, D-187—188
  magnetic
    composition, % by wt., E-117—120, 122—123
    heat treatment of, E-122—123
    properties, E-117—120
    uses, E-118—120
  melting point, D-187—188
  modulus of elasticity, D-187—188
  specific gravity, D-187—188
  thermal conductivity, D-187—188
Commercial ionic exchange resins, properties, C-791—793
Commercial plastics
  composition, trade names and manufacturers, C-773—779
  properties, C-781—790
Common logarithms, see Logarithms, common
Compensation point, definition, F-97
Complementary color, definition, F-97
Component substances, law of, F-97
Compounds, definition, F-98
Compressibility
  definition, F-98
  isothermal, of some liquids, F-16—20
  rare earth metals, table, B-221
  water, ordinary, −20°C to 150°C, F-5—6
Compressibility, coefficient of, definition, F-97
Compressibility factor, liquid and gaseous oxygen, F-81
Compton effect, definition, F-98
Compton electron, definition, F-98
Compton wavelength, definition, F-98
Computer-generated holograms, definition, F-98
Computer Programs for Handling Technical Data, list of publications, F-369
Concentration, definition, F-98
Concentrative properties of aqueous solutions, D-227—276
Condensation number, definition, F-324
Condensers in parallel and series, equations, F-98
Condosity
  inorganic substances, selected, varying concentration in aqueous solution, table, D-229—276
  organic substances, selected, varying concentration in aqueous solution, table, D-229—276
Conductance, definition, F-98, 119
Conductance, ionic equivalent, definition, F-112
Conductance, molar, definition, F-117
Conductance, specific, definition, F-126
Conductances, electrical, for fair-weather atmosphere, F-2, 212
Conduction bands of semiconductors, data, E-106
Conductivity, electrical, definition, F-98
Conductivity, thermal, F-98
Conductors, definition, F-98
Conductors, wire, allowable carrying capacities, F-164
Conjugate foci, definition, F-98
Conservation of energy, definition, F-98
Conservation of energy, law of, F-98
Conservation of mass, definition, F-98
Conservation of momentum, law of, F-98
Constant of aberration, definition, F-98
Constants
  dielectric, see Dielectric constant
  dissociation, see Dissociation constants
  fundamental physical, values, F-244—245
  gases, Van der Waals' for, D-194
  inorganic compounds, physical constants, B-51—144
  involving the numbers 2 and 3, A-128
  ionization, see Ionization constants
  Madelung, crystal lattice energy, F-242
  minerals, physical constants, B-181—185
  molecular, for gases, F-211
  organic compounds, physical constants, C-81—548
  organometallic compounds, physical constants, C-686—721
  satellite geodesy, F-192
  solubility product, see Solubility product constant
  tables, bibiolographic information, F-358
Constitutive property, definition, F-98
Continents, area of, total, F-197
Continuous charge distribution, definition, F-112
Contrast of fringes, definition, F-98
Conversion
  barometric readings, tables, E-38—39
  concentration of solution, formulas, D-154
  cryogenic properties of gases, units, B-389
  decimal parts of a degree to minutes and seconds, A-31
  degrees and decimal fractions to radians, A-30
  degrees, minutes and seconds to radians, A-30
  degrees—radians, radians to degrees, A-30
  energy to wavelength, E-192
  energy units, factors for, F-246
  factors, master table, F-307—329
  hydrometer, relation between density and degrees Baume, F-3
  illumination, units of, E-216
  mils—radians—degrees, A-59
  minutes and seconds to decimal parts of a degree, A-60
  radians to degrees, minutes and seconds, A-59
  temperature, Celsius (or Centigrade) degrees to Fahrenheit degrees, formula and tables, F-134—156
  thermal conductivity units, E-17

  transparency to optical density, table, E-415—417
  viscosity, units of kinematic and absolute, F-49—50
Conversion of $(\log_{10} x)$ to $(RT \log_e x)$, in calories, table, F-329
Cooling, definition, F-98
Cooling, Newton's law of, F-118
Coordinate system, standard, in colorimetry, E-411
Coordination compounds
  definitions, B-42
  naming, in inorganic chemistry, B-42
Copper (Cu 29)
  atomic number, B-1, 7
  atomic weight, B-1, 7
  boiling point, B-1, 7
  electronic configuration, B-1
  gravimetric factors, logs of, B-156
  history, B-7
  line spectra of, E-240—242
  melting point, B-7
  properties in general, B-7—8
  properties, specific, see under Elements, Inorganic compounds, Metals
  production, general methods, B-7—8
  specific gravity, B-7
  symbol, B-1, 7
  uses, B-8
  wire, cross section and mass, F-167—168
  wire tables, F-164—166
Coriolis acceleration, definition, F-98
Corning colored filters
  identifying numbers, thickness, color, properties, E-395
  transmittance, tables, E-396—401
Correction, barometric, for molecular elevation of boiling points of substances in various solvents, D-191
Correction, boiling points to standard pressure
  equation and sample calculations, D-192
  organic compounds, table, D-192—193
Correction, emergent stem, for liquid-in-glass thermometers, D-195
Correction, temperature, volumetric solutions to give volume at 20°C, F-2
Correction factors, weighings in air to vacuo, D-146
Correlation charts, infrared, F-247—255
Cosecants and secants, natural trigonometric functions for angles in χ radians, A-56
Cosine, sine functions for special multiples of π radians, A-58
Cosine, tangent, sine, cotangent for angles in π radians, natural trigonometric functions, A-57
Cosmic rays
  definition, F-98
  wavelength in Å, E-214
Cosmotron, definition, F-98
Cost, approximate, chemical elements, B-2—27
Cotangent, sine, tangent, cosine, for angles in π radians, natural trigonometric function, A-57
Couette flow, definition, F-98
Coulomb, definition, F-98
Coulomb's law, force between two charges, F-107
Counterradiation, definition, F-98
Couple, definition, F-98—99
Couple acting on a magnet, definition and formulas, F-99
Cowling number, definition, F-334
Craya-Cutet number, F-334
Creatinine, see also Organic compounds
  concentrative properties of, in varying concentration, D-235
Crispation group, definition, F-335
Critical data, sources of, F-348—359
Critical field data of some superconductive materials, E-98
Critical mass, definition, F-99
Critical point, definition, F-99
Critical pressure
  inorganic compounds, table, F-89
  organic compounds, table, F-88—89
Critical temperature
  definition, F-99
  inorganic compounds, table, F-89
  organic compounds, table, F-88—89
  superconductive substances, E-92—103
Critical values, ozone and oxygen, F-80—81
Crocco number, definition, F-335
Crossed polarizer, definition, F-99
Cross-section, nuclear, definition, F-99
Cross-section and mass of wires, F-167—168
Cross-section projects, F-353
Cryogenic properties of gases, B-388
Cryogenic temperature, see Low temperatures
Cryohydrate, definition, F-99
Cryopumping, definition, F-99
Cryotron, definition, F-99
Crystal, ideal, definition, F-99
Crystal lattice energy
  and Madelung constant, F-242
  calculation of, F-242
Crystal structures, superconductive compounds and alloys, E-88—97
Crystalline form
  inorganic compounds, table, B-51—144
  minerals, tables, B-181—219
  organic compounds, table, C-81—548
  organometallic compounds, table, C-686—721
  rare earth metals, table, B-222
  refractory materials, table, D-51—58
Crystalline matter, definition, F-99
Crystalline phase, naming of, in inorganic chemistry, B-36
Crystallographic projects yielding critical data, F-350—352
Crystals, dielectric, thermal conductivity, E-4
Crystals, lattice spacing of common analysing, E-203
Cubic isomorphs, diffraction data, E-208—211
Cubits, conversion factors for, F-312
Cupferron (solution), preparation of, D-133
Cupric sulfate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-235
Curie, definition, F-99
Curie point, definition, F-99
Curie points of ferromagnetic elements, E-121
Curie temperature, glass sealing and lead wire materials, F-160—161
Curie-Weiss law, definition, F-99
Curie's law, equation, F-99
Curium (Cm 96)
  atomic number, B-1, 8

  atomic weight, B-8
  electronic configuration, B-1
  history, B-8
  line spectra of, E-242
  melting point, B-8
  price, approximate, B-8
  production, general methods, B-8
  properties in general, B-8
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-8
  symbols, B-1, 8
  uses, B-8
  valence, B-8
Current (electric), definition, F-99
Current carrying capacities for copper and aluminum, F-164
Current in a simple circuit, equation, F-99
Currents, electrical, in fair-weather atmosphere, F-212
CW laser, definition, F-99
Cyanates, lattice energy, D-90—91
Cyanide, lattice energy, D-91
Cyclic alkanes and alkenes, heat capacity at 300 and 800 K, D-178
Cyclic hydrocarbons with side chains, nomenclature rule, C-28—29
Cyclotron, definition, F-99

D

Dalton, definition, F-99
Dalton's law of partial pressure, formula, F-99
Daltons, conversion factors for, F-312
Damkohler group, definition, F-335
Darcy number, definition, F-335, 341
Data projects, numerical, sources of critical data, F-348—359
Data, reference, list of publications, F-360—370
Day, average solar, of planets, their satellites and some asteroids, F-178
Day, definition, F-99
Day, ephemeris, definition, F-105
Day, sidereal, definition, F-125
Dean number, definition, F-335
Deborah number, definition, F-335
Deborah number, generalized, definition, F-341
DeBroglie wavelength, definition and equations, F-99
Debye-Falkenhagen effect, definition, F-99
Debye length, definition, F-100
Debye-Sommerfeld equation, constants for some substances, D-185
Decay
  definition, F-100
  modes of, for isotopes, table, B-237—320
Decay constant, definition and equations, F-100
Decay product, definition, F-100
Deci-normal solutions
  oxidation and reduction reagents, table, D-139
  salts and other reagents, table, D-138
Decibels, definition, F-100
Decimal fractions, four-place mantissas for common logarithms, A-3—4
Decimal parts of a degree to minutes and seconds, conversion table, A-31
Decl, definition, F-100
Declination, definition, F-100
Decomposition, definition, F-100
Definite integrals, A-90—99
Definite proportions, law of, F-100
Definitions and formulas, F-90—132
Degree, definition, F-100
Degree of association, definition, F-100
Degree of dissociation, definition, F-100
Degree of freedom, definition, F-100
Degrees, minutes and seconds to decimal parts, conversion table, A-31
Degrees, minutes, and seconds to radians, conversion table, A-30
Degrees—radians, conversion table, A-30
Degrees—radians—mils. conversion table, A-30
Deka, definition, F-100
Delayed neutrons, definition, F-100
Delivery number, definition, F-335
Delta ray, definition, F-100
Density
  air, dry
    calculation, formula, F-9, 11
    tables of values, F-9, 11
  air, moist
    calculation, tables of factors for, F-9
    table, 5°C to 35°C, E-10
  alcohol, ethyl, table, F-3
  alloys, magnetic, E-122
  amino acids, crystalline, table, C-760
  ammonia, saturated vapor and liquid, −60°F to 124°F, E-27—28
  buffer solutions, standard aqueous at 25°C, D-147
  carbon dioxide, saturated vapor and liquid, −20°F to 88°F, E-29
  change with altitude in standard atmosphere, graph, F-209
  definition, F-100
  deuterium oxide, table, F-4
  Earth atmosphere at elevations to 160 km, F-204
  elements, liquid state, table, B-223—225, 228—230
  fluorocarbon refrigerants, E-34—35
  glass sealing and lead wire materials, F-160—161
  heavy liquids for mineral separation, E-382
  hydrometer conversion tables
    Baume', degrees, relation to density, F-3
    Baume' and Twaddell scales, relation to density, F-4
  inorganic compounds, table, B-51—144
  inorganic substances, selected, varying concentration in aqueous solution, table, D-229—276
  insulating materials, E-5
  liquids, various, F-3
  mercury, −10°C to 360°C, F-7
  mercury, saturated vapor and liquid, 402°F to 1000°F, E-33
  minerals, table, B-181—185
  of film, definition, F-100
  organic compounds, several, E-31—33
  organic compounds, table, C-81—548
  organic substances, selected, varying concentration in aqueous solution, table, D-229—276
  organometallic compounds, table, C-686—721
  oxygen, liquid and gaseous, F-80—81

  ozone, liquid and gaseous, F-80
  planets, their satellites, Sun compared to Earth's, F-183
  planets, their satellites and some asteroids, g/cc, F-176
  quartz, clear fused, F-80
  rare earth metals, table, B-221
  semiconductors, table, E-102—104
  sodium and Na-K alloys, F-83
  sodium, potassium, and Na-K alloys, physical properties, F-83—84
  solid materials, various, table, F-1
  sulfur dioxide, saturated vapor and liquid, −40°F to 100°F, E-30
  sulfuric acid, aqueous, 1%—100% solution, specific gravity, F-7
  sulfuric acid, fuming, 0%—100%, table, F-8
  units from various hydrometers, F-3
  water, ordinary, −20°C to 150°C, F-5—6
  water, pure, air-free, 0°C to 100°C, F-11
  waxes, table, C-769
Density, relative, conversion to, D-227
Depletion layer, definition, F-100
Derivatives, calculus, table, A-32—35
Derivatives, partial
  fundamental thermodynamic variables, D-121
  thermodynamic computation of, D-120
Deryagin number, definition, F-335
Desiccants, efficiency of, E-41
Detention wave, definition, F-100
Deuterium, definition, F-100
Deuterium, properties, see Hydrogen
Deuterium oxide, see also Inorganic compounds
  density, table, F-4
  dielectric constant 4°C to 100°C, E-61
Deuteron, definition, F-100
Dew point, definition, F-100
Dew point—relative humidity table, E-44
Dextran, see also Organic compounds
  concentrative properties of, in varying concentration, D-235
Diabatic process, definition, F-100
Diamagnetic materials, definition, F-100
Diamagnetic shielding factor, spherical H_2O sample, F-247
Diamagnetic susceptibilities, organic compounds
  indexed by chemical formula, E-133—136
  table of values, E-128—133
Diamagnetic susceptibility of organosilicon compounds, E-137—141
Diameter group, definition, F-335
Diameter of gas molecules, F-211
Diatomic molecules, bond strengths, F-220—229
Dielectric, definition, F-100
Dielectric constant
  ceramics, E-60
  definition and equation, F-100
  deuterium oxide, 4°C—100°C, E-61
  fluorocarbon refrigerants, E-34—35
  gases at 760 mm, E-59

  glasses, E-60
  liquid parahydrogen vs. temperature and pressure, E-62
  liquids, inorganic, pure, E-55—56
  liquids, organic, pure, E-56—58
  liquids, standard, pure, E-55
  plastics, various, E-60
  rubber, various, E-60
  solids, E-58
  water, 0°C—100°C, E-61
  waxes, E-60
Dielectrics, definition, F-101
Dielectric strength, definition, F-101
Differential equations, linear, with constant coefficients, solution of, A-105
Differential equations, method of solution, A-120—122
Differential equations, special formulas, tables, A-105—119
Diffraction, definition, F-101
Diffraction data for cubic isomorphs, E-208—211
Diffraction efficiency, definition, F-101
Diffraction fanning, definition, F-101
Diffraction grating, equation, F-101
Diffuse reflection, definition, F-101
Diffuse sky radiation, definition, F-101
Diffusion, coefficient of, see also Diffusivity
  definition and formula, F-62, 101
  electrolytes, strong, table, F-62
  electrolytes, weak and non-electrolytes, F-62
  gases into air, F-62
Diffusion, equation, F-101
Diffusion data, metals into metals, F-63—71
Diffusion group, definition, F-335
Diffusivity
  equation, F-101
  gases in liquids, F-61
Diffusivity of heat, equation, F-101
Dilute acid reagents, preparations of, D-130
Dilute basic reagents, preparations of, D-130
Dilution, heat of, acids, table, D-117—118
Dimensional formulae, explanation of, F-101
Dimensionless groups
  alphabetical lists by name, F-334—343
  identifying, tables for, F-344—347
  nomenclature, F-330
Diminution of pressure at the side of a moving stream, equation, F-101
Dip, definition, F-101
Dipole, definition, F-101
Dipole moment, definition and equation, F-101
Dipole moment, molecular, definition, F-101
Dipole moments

  surface density, definition, F-128
  symbols used, F-293
  systems of quantities and units, F-300—302
  thunderstorm, description, F-213
Electrochemical equivalent, definition, F-103
Electrochemical series
  alphabetical listing, D-155—157
  index by increasing negative value, D-159—160
  index by increasing positive value, D-157—159
Electrolysis, equation, F-103
Electrolyte, conductivity, Kohlrausch's law, F-114
Electrolytes, uni-univalent, heats of solution of, D-118
Electrolytes and non-electrolytes, diffusion coefficient, F-62
Electrolytes in aqueous solutions at 25°C, equivalent conductances of, D-169
Electrolytic cell constant, definition, F-103
Electrolytic dissociation theory, F-103
Electrolytic solution tension theory, F-103
Electrolytic solutions
  Debye-Falkenhagen effect, F-99
  definition of terms, F-103
  Kohlrausch law of independent migration of ions, F-114
  Walden's rule, F-131
  Wien effect, F-132
Electromagnetic energy, transverse, definition, F-130
Electromagnetic radiation, definition, F-103
Electromagnetic spectrum, definition, F-103-104
Electromotive force
  definition, F-104
  Lenz's law, F-115
  Nernst effect in, F-118
Electromotive series, definition, F-104
Electron, definition, F-104
Electron affinities, atoms, molecules and radicals, E-67
Electron charge, specific, F-244
Electron Compton wavelength, value, F-244
Electron emission
  secondary, description, E-379
  secondary, tables of values, E-379—380
  tungsten, E-394
Electron g-factor, value, F-244
Electron impact method, ionization potentials of molecules, values, E-75—79
Electron mobility, semiconductors, E-102—105
Electron rest mass, value, F-244
Electron work function of the elements, E-82—83
Electron-volt, definition, F-104
Electronegative constitutents in naming compounds, B-30—31
Electronic configuration, chemical elements, B-1
Electrophoretic effect, definition, F-104
Electropositive constituent in naming compounds, B-30—32
Electrostatic unit, definition, F-104
Element
  definition, F-104
Element 104
  electronic configuration, B-1
  history, B-8
  production, general methods, B-8
  properties in general, B-8
Element 105
  history, B-8—9
  production, general methods, B-8—9
  properties, general, B-8—9
Element 106
  history, B-9
  properties, general, B-9
Element 107
  history, B-9
Element 110, search for, B-3
Elementary charge, value, F-244
Elementary forms, integrals, A-41—42
Elementary particles, see Particles, elementary
Elements, see also Minerals, Inogranic compounds, Organic compounds, Gases
  angle values and bond length between elements, F-218
  boiling points °C, table, D-190
  boiling points °K, low boiling, D-190
  bond length and angle values between elements, F-218
  bond lengths, table, F-217
  bond lengths between carbon and other elements, F-216
  cryogenic properties (gases), B-388

crystal ionic radii, F-214—215
density, liquid elements, B-223—225
density of some minerals, B-186
determination of by organic analytical reagents, table D-140—143
diffusion data for metals into metals, F-63—71
Earth's crust, in grams per metric ton, F-200
electrical resistivity and temperature coefficient, F-171—172
electron work functions, E-82—83
electronic configuration, table, B-1
emissivity of tungsten, E-345
enthalpy, metals at low temperatures, D-183—185
entropy, D-62—63
ferromagnetic, saturation constants and curie points, E-121
general information, B-2—3
hardness data for several, E-24
heat of transition, D-62—63
heats of formation of gaseous atoms from elements, F-352
index of refraction of several, E-382
ionization potentials in volts, E-68—69
ions, thermodynamic properties, D-67—78
isotopes of, table, B-237—320
K X-ray lines, E-203
lanthanides, definition, F-114
line spectra of, E-217—349
liquid state, density, B-264—265, 269—271
magnetic susceptibility, E-123—128
melting points °C, table, D-190
metals, thermal properties of, pure, D-189
nomenclature, rules, B-28
oxygen, fixed point properties of, F-81
oxygen, physical constants of, F-80
radiative transition probabilities
  K X-ray lines, E-203
  L X-ray lines, E-204—205
rare earth metals, properties, B-221—222
sea water, present in solution, F-204
space group, B-186, 218
specific heat
  metals at low temperatures, D-183—185
  table at 25°C, D-181—182
structure type, B-186—218
superconductive, properties of, E-88—89
superconductive, thin films of, critical temperatures, E-88
surface tension, of liquid, table, F-25—38
thermal conductivity
  gaseous helium, nitrogen and water, E-3
  liquids, several, E-11
  metals, several, E-10
  table of values, E-12—16
thermal neutron capture cross section, table, B-237—320
thermodynamic functions, copper, silver, gold, D-80—81
thermodynamic properties, D-62—63, 67—68
transuranic, definition, F-130
triple point °K, low boiling, D-190
Van der Waals' constants for gases, table, D-194
Van der Waals' radii in A, D-194
vapor pressure
  inorganic compounds (including some elements), D-199—203
  table, D-221
  table of several, D-198
  table of some that are gaseous at standard conditions, D-222—223
X-ray absorption edges, *K* and *L* edges, E-206
X-ray atomic energy levels, E-192—202
X-ray cross sections, E-147—155
X-ray crystallographic data (minerals), B-186—218
X-ray crystallographic data, table, B-186—218
X-ray wavelengths, indexed by element, E-153—166
X-ray wavelengths in numerical order of emission lines and absorption edges, E-167—190
Ellipse transfer data, Hohmann, planets, F-188—191
Elliptical polarization, definition, F-104
Ellipticity, planets, satellites and the Sun, F-176
Ellis number, definition, F-335
Elongation definition, F-104
Elongation at any instant, definition, F-104
Elsasser number, definition, F-335
EMF series, D-155—200
Emission, electron, tungsten, E-394
  emission, line, spectra of the elements, E-217—349
Emission, secondary electron
  definition, E-379
  elements, several, E-379
  inorganic compounds, several, E-379
Emission spectrum, definition, F-104
Emissive power, definition, F-104
Emissivity
  color, tungsten, table, E-394
  defining equations for, E-215
  definition, F-104
  metals, alloys and brick, E-392—393
  of total radiation for various materials, E-392—393
  points and metals, low temperature, E-392—393
  spectral
    metals and alloys, table, E-394
    oxides and oxidized metals, E-394
    tungsten, table, E-394
  symbols and units for, E-215
  tungsten, E-381, 394
Emittance, definition, F-104
Empirical formula, definition, B-30
Emulsion, definition, F-104
Enantiotropic, definition, F-104
Energy, crystal lattice, calculation of, F-242
Energy, definition, F-104
Energy conversion factors, F-246
Energy gap, minimums, semiconductors, E-102—105
Energy, internal, definition and equation, F-112
Energy, kinetic, definition, F-114
Energy, luminous, definition, F-115
Energy of a charge, equation, F-104
Energy of rotation, equation, F-104
Energy of the electric field, equation, F-104
Energy product, maximum, magnetic alloys, E-117—118, 123
Energy-to-wavelength conversion (X-ray), E-147

Energy-wavelength conversion factor, F-246
Engineering
  abbreviations for terms, American Standard, F-304—306
  conversion factors, F-307—329
  dimensionless groups, F-330—347
  steam tables, E-18—26
Engler degrees in viscosity measurement, F-49
Enthalpy, see also Thermodynamic properties
  air, 300°K to 2800°K at 20, 30 and 40 Atm., F-13—15
  ammonia, E-27—28
  calculation of, equations, D-61
  calculations for copper, silver, gold, values for, D-80—81
  calculations for elements, values for, D-62—63
  calculations for oxides, values for, D-64—66
  carbon dioxide, E-29
  conversion factors from cgs units to SI and English units, for air, F-12
  equation, F-104
  hydrocarbons, alkane, D-103—116
  key values, selected ions and substances, D-85—87
  metals and other solids at low temperatures, D-183—185
  organic compounds, several, E-31—33
  steam, saturated and unsaturated water (steam tables), E-18—23
  sulfur dioxide, E-30
  water
    above 100°C, table, D-175
  air, saturated 0°—100°C at 1 atm, table, D-175
  air-free 0°—100°C at 1 atm, table, D-174
Enthalpy function, alkane hydrocarbons, D-103—116
Enthalpy number, reaction, definition, F-343
Enthalpy of formation, alkane hydrocarbons, D-103—116
Entropy, see also Thermodynamic properties
  ammonia, −60°F to 124°F, E-27—28
  calculation, equation, D-61
  calculations for copper, silver, gold, value for, D-80—81
  carbon dioxide, −20°F to 88°F, E-29
  definition and equation, F-104—105
  elements, table, D-67—78
  elements (at 298°K), table, D-62—63
  hydrocarbons, alkane, D-103—116
  hydrocarbons, table, D-82—84
  inorganic compounds, table, D-67—78
  key values, selected ions and substances, D-85—87
  mercury, 402°F to 1000°F, E-33
  organic compounds, several, E-31—33
  organic compounds, table, D-78—79
  oxides (at 298°K), table, D-64—66
  steam, saturated, and saturated water (steam tables), E-18—23
  sulfur dioxide, −40°F to 1000°F, E-30
  transition, chemical elements, D-62—63
Entropy of sublimation of some organic compounds, C-722—723
Eotvos number, definition, F-335
Ephemeris day, definition, F-105
Ephemeris second, definition, F-105
Ephemeris time, definition, F-105
Equations, differential, method of solution, A-120—122
Equations, differential, special formulas, tables, A-105—119
Equatorial system, definition, F-105
Equilibrium, chemical, definition, F-105
Equilibrium constant, definition, F-105
Equilibrium constant, log of
  elements, table, D-67—78
  hydrocarbons, table, D-82—84
  inorganic compounds, table, D-67—78
  organic compounds, table, D-78—79
Equivalence point, formula, calculation of titration data, D-154
Equivalent conductance
  definition, F-105
  electrolytes, in aqueous solutions at 25°C, D-169
  hydrohalogen acids in aqueous solution, D-170—173
  ions, table, D-169
  limiting, definition, F-115
  limiting ionic, definition, F-115
Equivalent conductance, definition, F-105
Equivalent temperature, definition and equations, F-105
Equivalent weight, definition, F-105
Erbium (Er 68)
  atomic number, B-1, 9
  atomic weight, B-9
  boiling point, B-9
  electronic configuration, B-1
  gravimetric factors, logs of, B-156
  history, B-9
  line spectra of, E-245—246
  melting point, B-9
  price, approximate, B-9
  production, general methods, B-9
  properties in general, B-9
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-9
  symbol, B-1, 9
  uses, B-9
  valence, B-9
ERG, unit of work and energy, definition, F-105
Esbach's reagent, preparation of, D-134
Escape velocity, definition and equation, F-105
Escape velocity, planets, satellites and the Sun, F-180
Eschka's compound, preparation of, D-134
Estrogens
  formulae, chemical, C-750—751
  properties, C-750—751
  uses, C-739
Ethanol, see also Organic compounds
  concentrative properties of, in varying concentration, D-236
Ethyl alcohol, see Ethanol
Ethylene glycol, see also Organic compounds
  concentrative properties of, in varying concentration, D-237
(Ethylenedinitrilo) tetraacetic acid disodium salt
  concentrative properties of, in varying concentration, D-237
Ettinghausen's effect, F-105
Euler equation, method of solution, A-122
Euler number, definition, F-335

Euler number, modified, definition, F-341
Euler's constant, value of, A-128
Europium (Eu 63)
  atomic number, B-1, 9
  atomic weight, B-9
  boiling point, B-9
  electronic configuration, B-1
  gravimetric factors, logs of, B-156
  history, B-9
  line spectra of, E-246—249
  melting point, B-9
  price, approximate, B-9
  production, general methods, B-9
  properties in general, B-9
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-9
  symbol, B-1, 9
  uses, B-9
  valence, B-9
Eutectic, definition, F-105
Evaporation, tungsten, table of values, E-394
Evaporation number, definition, F-335
Exact equation, method of solution, A-120
Exchange coefficients, definition and equations, F-105
Expansion, coefficient of linear
  metals, pure, D-189
  metals and alloys, commercial, D-187—188
Expansion, Fourier, for basic periodic functions, A-102—103
Expansion, thermal, table for tungsten, E-394
Expansion number, definition, E-391
Expansion of gases, laws and equations, F-105—106
Expansivity, see Expansion, coefficient of linear
Explosive limits
  common refrigerants, % by volume, E-37
  inflammability limits, gases and vapors, D-122
Exponential forms, integrals, A-83—87
Exponential functions; logarithms, table, A-9—15
Extender white pigments, physical properties, F-85
Extinction coefficient, definition and equations, F-106
Extinction cross section, definition, F-106
Extraterrestrial radiation, definition, F-106

F

Fabrication, types of, commercial plastics, table, C-781—790
Fahrenheit degree, definition, F-128
Fahrenheit degrees to Celsius degrees, conversion tables, F-134—156
Fahrenheit degrees to degrees Celsius, conversion formulae, F-134
Fahrenheit temperature scale, definition, F-106
Falling bodies, see also Projectiles,
  equations, F-106
Fanning friction number, definition, F-335
Far infrared vibrational frequency correlation chart, F-254—255
Farad
  definition, F-106
  value in e.s.u., F-96
Faraday, new determination of (1960), F-106
Faraday constant, definition, F-106
Faraday constant, value, F-244
Faraday effect
  definition, F-106
  formulas involving, E-413
Faraday's laws, F-106
Fast neutron, definition, F-106
Fast reactor, definition F-106
Fathoms, conversion factors for, F-314
Fats and oils
  animal and plant
    iodine value, D-225
  melting point °C, D-225
    refraction, index of, D-225
    saponification value, D-225
    saturated fatty acids, constituent %, D-226
  specific gravity or density, D-225
  unsaturated fatty acids, constituent %, D-226
Fatty acids, concentration of, in various fats and oils, D-226
Fedorov number, definition, F-335
Fehling's solution, preparation of, D-134
Femto, definition, F-106
Fenske number, definition, F-336
Fermat's principle, F-106
Fermi, definition, F-106
Fermium (Fm 100)
  atomic number, B-1, 9
  atomic weight, B-9
  electronic configuration, B-1
  history, B-9
  production, general methods, B-9
  properties in general, B-9
  properties, specific, see under Elements, Inorganic compounds
  symbol, B-1, 9
Ferric chloride, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-237
Ferrimagnetic materials, definition, F-106
Ferromagnetic elements, saturation constants and Curie points, E-395
Ferromagnetic materials, definition, F-106
Ferromagnetic substances, Curie point, F-99
Field intensity, equation, F-103
Film, density of, definition, F-100
Filters, colored
  Corning, identifying number, thickness, color and properties, E-395
  for standard illuminants, E-411
  transmittance, Corning, tables, E-396—397
  transmittance percent, Wratten, tables, E-403—409
    Wratten, identifying numbers, color, use, stability, E-402—403
Fine structure constant, value, F-244
Fineness coefficient, definition, F-336
Firkins, conversion factors for, F-314
First law of thermodynamics,
  definition and equations, F-106—107
First order equation, linear,
  method of solution A-120
Fission, definition, F-107

Fixed points for parahydrogen, F-82
Flame
  luminance of candle and acetylene, E-213
  standards, various lamps, E-213
  wavelengths of various for spectroscope calibration, E-214
Flame tests, colors, general index to compounds, D-129
Flammability, see Inflammability
Flash point, common refrigerants, E-37
Fleming's rule, F-107
Fliegner numbers, definition, F-336
Flow coefficient, definition, F-336
Fluidity
  definition, F-107
  inorganic substances, selected, varying concentration in aqueous solution, table, D-229—276
  organic substances, selected, varying concentration in aqueous solution, table, D-229—276
Fluidization number, definition, F-336
Fluorescence, definition, F-107
Fluorescent lamps, efficacies of, E-212
Fluorine (F 9)
  atomic number, B-1, 9
  atomic weight, B-9
  boiling point, B-9
  density, B-9
  electronic configuration, B-1
  gravimetric factors, logs of, B-156—157
  history, B-9
  line spectra of, E-249—250
  melting point, B-9
  production, general methods, B-9
  properties in general, B-9
  properties, specific, see under Elements, Gases, Inorganic compounds
  specific gravity, B-9
  symbol, B-1, 9
  transition probabilities, E-359—360
  uses, B-9
  valence, B-9
Fluorocarbon refrigerants, comparative toxicity, E-36
Fluorocarbon refrigerants, physical properties, E-34—35
Fluorocarbons, liquid, thermal conductivity, E-36
Fluorite, index of refraction, E-386
Fluorite, transmissibility for radiations, E-410
Flux rates, dimensionless groups, F-346
Focal length, definition, F-107
Focal plane, definition, F-107
Focal point, definition, F-107
Foci, conjugate, definition, F-98
Focus, definition, F-107
Focus, principal, of the lens, definition, F-122
Folin's mixture, preparation of, D-134
Foods, approximate pH values, D-149
Foot-candle, conversion factors, E-216
Foot-candle, definition, F-107
Foot-lambert, definition, F-107
Force, definition, F-107
Force between two charges, equations, F-107
Force between two magnetic poles, equations, F-107
Formates, lattice energy, D-91
Formation, heat of, see Heat of formation
Formic acid, see also Organic compounds
  concentrative properties of, in varying concentration, D-238
Forms involving trigonometric functions, integrals, A-65—77
Forms involving trigonometric substitutions, integrals, A-80
Formula index, organic compounds, C-615—644
Formulas
  calculation of quantities in chemistry and physics, F-90—132
  Calculus, tables, A-32—99
  chemical
    definition, F-107
    inorganic compounds, table, B-51—144
    organic compounds, table, C-81—548
  concentration of solution, conversion, D-154
  differential equations, special formulas, A-105—119
  dimensionless groups, F-320—337
  empirical, definition, B-30
  Fourier series, A-99—104
  molecular, definition, B-30
  naming chemical
    inorganic compounds, B-30—32
    organic compounds, C-1—44
  specific properties, calculation, see Index under desired property
  structural, of organic compounds, in Alpha Numeric as they occur in Organic Compounds, table, C-549—614
  thermodynamic, D-120—121
  titration data calculation, pH vs. ml of reagent, D-154
Foucault current, definition, F-102
Fourier expansions for basic periodic functions, A-102—103
Fourier number, definition, F-336, 341
Fourier series, A-99—104
Fourier series, auxiliary formulas, A-104
Fourier transform plane, definition, F-107
Four-place common logarithms, table, A-1—2
Four-place mantissas for common logarithms, table, A-1—2
Fractions, decimal, four-place mantissas for common logarithms of, A-3—4
Francium (Fr 87)
  atomic weight, B-1, 9
  boiling point, B-9
  electronic configuration, B-1
  history, B-9—10
  melting point, B-9
  production, general methods, B-10
  properties in general, B-9—10
  properties, specific, see under Elements, Inorganic compounds
  symbol, B-1, 9
  uses, B-10
  valence, B-9
Frank-Kamenetskii, number, definition, F-341
Franklin, definition, F-302

- specific gravity, B-10
- symbol, B-10
- uses, B-10
- valence, B-10

Gibbs energy function, alkane hydrocarbons, D-103—116
Gibbs energy of formation, alkane hydrocarbons, D-103—116
Gibbs free energy, definition, F-108
Gibbs function, definition, F-108—109
Gibbs' phase rule, F-109
Giga, definition, F-109
Gilbert, definition, F-109
Gills, conversion factors for, F-315
Glass
- dielectric constants of various, E-60
- filters, Corning, transmission of, E-395—401
- friction, coefficient of, static, F-21
- index of refraction of several types, E-386
- quartz
  - physical constants for clear, fused, F-80
  - refraction, index of, for fused, E-387
  - transmissibility for radiations, E-410
- thermal conductivities of various, E-6—9
- transmissibility for radiations of several, E-281
- values of F for various, D-195
- velocity of sound in various, E-47

Glass scale, temperature correction, metric units, E-41
Glass sealing materials, physical properties, F-160—161
Glassware, calibration of volumetric, D-144
Global radiation, definition, F-109
Glucose (Dextrose), see also Organic compounds
- concentrative properties of, in varying concentration, D-239

Glycerol, see also Organic compounds
- concentrative properties of, in varying concentration, D-239—240

Glycinates, lattice energy, D-91
Goertler parameter, definition, F-342
Gold (Au 79)
  atomic number, B-1, 10
  atomic weight, B-10
  aqua regia reagent, preparation, D-131
  boiling point, B-10
  electronic configuration, B-1
  gravimetric factors, logs of, B-157
  history, B-25
  line spectra of, E-255—256
  melting point, B-10
  prices, history of, B-10
  production, general methods, B-10
  properties in general, B-10—11
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-10
  symbol, B-10
  uses, B-11
  valence, B-10
Golden ratio, A-128
Goucher number, definition, F-336
Grades, conversion factors for, F-316
Graetz number, definition, F-316
Graham's law, F-109
Gram, unit of mass, definition, F-116
Gram atom or gram atomic weight, definition, F-109
Gram equivalent, definition, F-109
Gram formula weight, definition, F-109
Gram mole, definition, F-109
Gram molecular weight, definition, F-109
Gram molecule, definition, F-109
Grashof number, definition, F-336
Grashof number, diffusional, definition, F-342
Grashof number, magnetic, definition, F-342
Grating, diffraction, equations, F-101
Gratz number, definition, F-336
Gravimetric factors, table of logarithms, B-145—179
Gravitation, definition and equation, F-109
Gravitational constant
  definition, F-109
  Gaussian, defining the a.u., F-192
  planets, their satellites, Sun, F-183
  value of, F-245
Gravitational settling, terminal, of particles, F-283
Gravity
  acceleration, dimensionless groups, F-347
  acceleration due to, and length of the seconds pendulum, F-200
  definition, F-109
  planets, their satellites, Sun, compared to Earth's, F-185
  values, for planets and their satellites, F-180
  virtual, definition and equation, F-131
Greek and Russian alphabet, F-303
Group velocity, definition, F-131
Gukhman number, definition, F-336
Guldberg-Waage group, definition, F-336
Gunzberg's reagent, preparation of, D-134
Gyromagnetic ratio, proton, value, F-245

H

Hafnium (Hf 72)
  atomic number, B-1, 11
  atomic weight, B-11
  boiling point, B-11
  electronic configuration, B-1
  gravimetric factors, logs of, B-157
  history, B-11
  line spectra of, E-256—258
  melting point, B-11
  price, approximate, B-11
  production, general methods, B-11
  properties in general, B-11
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-11
  symbol, B-11
  uses, B-11
  valence, B-11
Hager's reagent, preparation of, E-357
Hahnium, see Element 105
Halates, lattice energy, D-91
Half-life
  definition, F-109
  isotope, radioactive, table, B-237—320
  radionuclides, table, B-378—386
Half-wave plate,
  definition, F-109
Halides, lattice energy, D-91—94
Hall coefficient, definition, F-336
Hall constant,
  definition and equation, F-109
Hall effect, definition, F-109
Hall mobility, definition, F-109
Halos, angular radius of, F-211
Hands, conversion factors for, F-316
Hantzsch-Widman notation for heterocyclic systems, C-33—34
Hanus solution, preparation of, D-134
Hardness
  definition, F-109
  minerals, metals, elements, tables, F-24
  minerals, Mohs' scale, table, B-181—185
  Mohs' scales, F-24
  Mohs' scale vs. Knoop scale, comparison of values, F-24
  plastics, Rockwell, table, C-781—790
  quartz, clear fused, F-80
  refractory materials, table, D-52—58
  Rockwell, glass sealing and lead wire materials, F-160—161
Harmonic
  definition and equations, F-109
Harmonic motion
  angular, definition, F-92
  simple, definition and equations, F-126
Harmonic motion of rotation, see Angular harmonic motion
Hartmann number, definition, F-336

Hatta number, definition, F-336
Hazard, human life
  elements, descriptive information for many, B-4—66
  limits of exposure to air contaminants, D-123—128
  limits of inflammability of gases and vapors in air and in oxygen, D-122
  radionuclides, permissible quarterly intake (oral and inhalation), B-378—386
  threshold limit, common refrigerants, E-37
  toxicity of fluorocarbon refrigerants, E-34—35
Head, pressure, dimensionless groups for, F-347
Head coefficient, definition, F-336
Heat, conversion factors for units of, F-307—329
Heat, definition, F-109
Heat capacity
  acids, table, D-119
  calculation for copper, silver, gold, values for, D-80—81
  calculation for elements, values for, D-62—63
  calculation of, equations, D-61
  calculation for oxides, values for, D-64—66
  definition, F-109
  hydrocarbons, alkane, D-103—116
  mercury, table, D-175
  organic gases at 300° and 800°K, D-178—180
  organic liquids and vapors at 25°C, D-176—177
  ozone and oxygen, F-80—81
  potassium and Na-K alloys, F-83
  rocks, several, E-16
  water, air-free 0°—100°C at 1 atm, table, D-174
Heat content, see also Enthalpy
  ammonia, −60°F to 124°F, E-27—28
  carbon dioxide, −20°F to 88°F, E-29
  equation, F-104
  mercury, 402°F to 1000°F, E-33
  organic compounds, several, E-31—33
  sulfur dioxide, −40°F to 100°F, E-30
  water, air-free, 1 atm. pressure, 0°—100°C, D-174
  water, air-saturated, 1 atm. pressure 0°—100°C, D-175
Heat effect, equation, F-110
Heat equivalent of fusion, definition, F-106
Heat fluxes, dimensionless groups for, F-346
Heat of combustion
  definition, F-110
  organic compounds, table, D-283—288
Heat of dilution, acids, table, D-116—117
Heat of formation
  elements, table, D-67—78
  free radicals, table, F-238—241
  gaseous atoms from elements in their standard states, F-224
  hydrocarbons, table, D-82—84
  inorganic compounds, table, D-67—78
  inorganic oxides, table, D-45—50
  ions, table, E-75—79
  organic compounds, calculation of, D-288
  organic compounds, table, D-78—79
  semiconductors, table, E-102—104
Heat of fusion
  inorganic compounds, table, B-231—235
  latent, definition, F-110
  organic compounds, table, C-724—726
Heat of solution, selected compounds, D-118
Heat of transition
  elements, chemical, table, D-62—63
  oxides, table, D-64—66
Heat of vaporization
  ammonia, −60°F to 124°F, E-27—28
  carbon dioxide, −20°F to 88°F, E-29
  mercury, 402°F to 1000°F, E-33
  organic compounds, several, E-31—33
  organic compounds, table, C-727—731
  rare earth metals, table, B-221
  sulfur dioxide, −40°F to 100°F, E-30
Heat quantity, definition, F-110
Heat summation, constant, Hess' law, F-110
Heat-transfer coefficient, overall,
  definition and equation, F-119
Heat transfer number, definition, F-336
Heavy water, see Deuterium oxide
Hecto, definition, F-110
Hedstrom number, definition, F-336
Hefner unit, definition, E-214, F-115
Hefner units, conversion factors for, F-317
Hehner number (value), definition, F-110
Height, virtual, definition, F-131
Heisenberg's theory of atomic structure, F-110
Helmert's equation, definition, F-90
Helmholtz double layer theory, definition, F-103
Helmholtz free energy, definition, F-110
Helmholtz function, definition, F-110
Helmholtz resonator group, definition, F-336
Helium (He 2)
  atomic number, B-1, 11
  atomic weight, B-11
  boiling point, B-11
  density, B-11
  electronic configuration, B-1
  history, B-11
  line spectra of, E-258
  melting point, B-11
  production, general methods, B-11
  properties in general, B-11
  properties, specific, see under Elements, Gases, Inorganic compounds
  symbol, B-11
  transition probabilities, E-363
  uses, B-11
  valence, B-11
Henry, definition, F-110
Henry's law, F-110
Hersey number, definition, F-336
Hertz, definition, F-110
Hess' law of constant heat summation, F-110
Hess number, definition, F-342
Heterocyclic systems, fundamental, nomenclature rules, C-33—43
Heterodyne, definition, F-110
Hildebrand expression, equation and sample calculation, C-732
Hobbmann orbit, definition, F-110
Hodgson number, definition, F-336
Hogsheads, conversion factors for, F-317
Hohmann ellipse transfer data, F-188—191

Hole, definition, F-110
Hole mobility, semiconductors, table, E-102—105
Holmium (Ho 67)
  atomic number, B-1, 11
  atomic weight, B-11
  boiling point, B-11
  electronic configuration, B-1
  gravimetric factors, logs of, B-157
  history, B-11
  line spectra of, E-258—260
  melting point, B-11
  price, approximate, B-11
  production, general methods, B-11
  properties in general, B-11
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-11
  symbol, B-11
  uses, B-11
  valence, B-11
Holocamera, definition, F-110
Holographic, definition, F-110
Holographic matched filter, definition, F-110
Hologram, definition, F-110
Hologram, double pass transmittance, definition, F-102
Holograms, computer generated, definition, F-98
Holography, definition, F-110
Homochronicity number, definition, F-342
Homochronous number, definition, F-336
Homogeneous atmosphere, definition, F-110
Homogeneous equation, method of solution, A-120-121
Hooke number, see also Cauchy number
  definition, F-336
Hooke's law, F-110
Hormones
  dipole moments of some, E-66
  steroid, see Steroid hormones
Horsepower, definition, F-110
Human exposure, limits of, see Hazard, human life
Humidity, absolute, definition, F-110
Humidity, constant
  saturated aqueous solutions, inorganic compounds, table, E-46
  sulfuric acid solutions, E-46
Humidity, relative, see Relative humidity
Huygens' principle, definition, F-110
Huygens' theory of light, F-110
Hydrides, lattice energy, D-94—95
Hydrocarbons, see also Organic compounds
  chemical thermodynamic properties, D-82—84
  nomenclature rules for, C-1—32
Hydrochloric acid, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-240
Hydrogen (H 1)
  atomic number, B-1, 11
  atomic weight, B-11
  boiling point, B-11
  density, B-11
  electronic configuration, B-1
  gravimetric factors, logs of, B-157
  history, B-11
  line spectra of, E-260
  melting point, B-11

  concentrative properties of selected, in varying concentration in aqueous solution, D-229—276
  constant humidity, aqueous tension, E-46
  critical pressure and critical temperature, F-89
  crystalline form, table, B-51—144
  density, table, B-51—144
  density of saturated vapor and liquid of several, E-27—33
  dielectric constants, tables, E-55-60
  diffusion data for several, tables, F-61—62
  dilution, heat of, acids, D-117—118
  dipole moments in gas phase, E-63
  dipole moments of solution, E-66
  dissociation constants
    acids in aqueous solution, D-167
    bases in aqueous solution, D-163
  drying agents, efficiency, E-41
  electrolytes, diffusion data, F-62
  emissivity, spectral, of oxides, E-394
  equivalent conductance
    electrolytes in aqueous solution at 25°C, D-169
    hydrohalogen acids in aqueous solution, D-170—173
  far infrared vibrational frequency correlation chart, F-255
  formulas, chemical, tables, B-51—144, 231—235
  fusion, heat of, table, B-231—235
  gravimetric factors, table of logarithms, B-139—179
  hazard, airborne, limits of human exposure, D-123—128
  heat capacity, acids, table, D-119
  heat of formation, oxides, table, D-45—50
  heat of formation, ions, E-75—79
  heat of fusion, table, B-231—235
  heat of vaporization of several, E-27—33
  index of refraction, of several in aqueous solutions, E-387
  index of refraction, table, B-51—144, E-382—383
  inflammability of gases and vapors
    in air, D-122
    in oxygen, D-122
  infrared spectra, chart of characteristic frequencies for radicals, F-265
  ionization constants of some acids, D-168
  ionization potentials of molecules, E-75—79
  isomorphs, cubic, diffraction data, E-208—211
  magnetic susceptibility, E-123—128
  melting point°C, table, B-51—144, 231—235
  molecular weight, table, B-51—144
  nomenclature, rules, B-27—49
  oxides, heat of formation, table, D-45—50
  physical constants, table, B-51—144
  physical properties, table, B-51—144
  reagents
    deci-normal solutions, table, D-138—139
    preparation of, D-130—137
  refraction, index of, table, B-51—144, E-347—348
  refractory materials, properties, tables, D-51—58
  secondary electron emission of several, E-380
  semiconductors, properties of, E-102—106
  solubility, table, B-51—144
  solubility chart, salts, D-145—146
  solubility product of selected, table, B-220
  solutes, surface tension, F-43
  solution, heat of, table, D-118
  specific heat of solid, D-183
  superconductive, critical field data, E-98
  superconductive, critical temperature and crystal structures, E-88—96
  superconductive, high critical magnetic-field, critical temperatures, E-99—100
  surface tension, liquid halogens, F-38
  surface tension, solutes in water and in organic solvents, F-43—44
  surface tension, various liquids, F-46—48
  table, master, of physical properties, B-51—144
  thermal conductivity of some, E-4
  thermodynamic key values of several, D-85—87
  thermodynamic properties
    heat capacity, acids, table, D-119
  heat of formation
    oxides, table, D-45—50
    table of values, D-67—78
  oxides, tables, D-64—66
  table of values, D-67—68
    tables of values for several, E-27—33
    vapor pressure
    depression in aqueous solution due to salts, table, E-1
    greater than 1 atm, table, D-202—203
    less than 1 atm, table, D-199—202
  viscosity
    gases, table, F-58—61
    liquids, table, F-52—57
Inositols, natural, see Carbohydrates
Insolation, definition, F-112
Insulating materials, thermal conductivity and density, E-5
Insulators, see also Dielectrics, definition, F-101

Magnetic rotary power
  equation for, F-125
  organic compounds, table, E-413—415
Magnetic susceptibility
  definition, F-128
  elements, E-123—128
  inorganic compounds, E-123—128
  organic compounds, E-128—136
Magnetism
  intensity of, definition, F-112
  quantity of, definition, F-122
  surface density of, definition, F-128
Magnetism and electricity
  CGS system of units, F-299—302
  conversion factors, table, F-307—329
  dimensionless groups, identification tables, F-344
  MKSA system of units, F-206—209
  symbols used, F-293
  systems of quantities and units, F-300—302
Magnetization
  hard and easy directions of, F-115
  intensity of, Curie's law, equation, F-99
  intensity of, equation, F-112
Magnetizing force, magnetic alloys, F-107
Magnetomotive force, definition, F-116
Magneton, Bohr, value, F-245
Magneton, nuclear, value, F-245
Magnetostriction, definition, F-116
Magnets, action of one on another, equations, F-129
Magnifying power, definition, F-116
Maievskii number, definition, F-337
Maltose, see also Organic compounds
  concentrative properties of, in varying concentration, D-244—245
Maltose hydrate, see also Organic compounds
  index of refraction, solutions at 20°C and 25°C, table, E-389
Manganese (Mn 25)
  atomic number, B-1, 14
  atomic weight, B-14
  boiling point, B-14
  electronic configuration, B-1
  gravimetric factors, logs of, B-162—163
  history, B-14
  line spectra of, E-275—276
  melting point, B-14
  production, general methods, B-14
  properties in general, B-14
  properties, specific, see under Elements, Inorganic compounds, Metals
  specific gravity, B-14
  symbol, B-14
  transition probabilities, E-364—365
  uses, B-14
  valence, B-14
Manganous sulfate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-245
Mannitol, see also Organic compounds
  concentrative properties of, in varying concentration, D-245—246
Mantissas for common logarithms
  four-place, table, A-1—2
Mantissas for common logarithms of decimal fractions, four-place A-3—4
Manufacturers
  ionic exchange resins, C-791—793
  plastics, C-773—779
Marangoni number, definition, F-337
Margoulis number, definition, F-338
Marme's reagent, preparation of, D-134
Marquis' reagent, preparation of, D-134
Mars, physical data for, F-176—187
Maser, definition, F-116
Mass
  atomic, see Atomic mass
  atmosphere, Earth's, F-198
  biosphere, Earth's, F-198
  definition and units, F-116—117
  Earth, F-193—196
  hydrosphere, Earth's, F-197
  lithosphere, Earth's, F-197
  planets, their satellites and some asteroids, kg, F-176
Mass absorption, definition, F-90
Mass action, law of, F-117
Mass and weight, definition, F-117
Mass attenuation coefficients
  air, E-146
  aluminum oxide, E-145
  animal proteins, E-146
  gases, E-144—146
  plastics, E-144—146
  quartz, E-145
  sterate, E-146
Mass by weighing on a balance with unequal arms, equation, F-117
Mass conductivity, definition, F-98
Mass defect, definition, F-117
Mass number, definition, F-117
Mass spectra, projects yielding data, F-356
Mass transfer, dimensionless groups for, F-346
Mass-energy equivalence, definition, F-117
Mass, pound, definition, F-121
Mass, virtual, definition, F-131
Mathematical constants, A-128
Mathematical operations, nomenclature for, in physics, F-286—288
Mathematical symbols, physics, recommended, F-296
Maximum work, Berthelot's principle, F-94
Maxwell, definition, F-117
Maxwell's rule, F-117
Mayer's reagent, preparation of, D-134
McAdams group, definition, F-337
Mean free path, Earth's atmosphere, elevations to 160 km., F-204
Mean free path, molecules for several gases, F-211
Mean free path vs. altitude, graph, F-210
Mean molecular weight vs. altitude, graph, F-209
Mean particle speed vs. altitude, graph, F-211
Measure and weight
  conversion factors used in, table, F-307—329
  units
    abbreviations of commonly used, F-306
    spelling and symbols, F-285

Mechanical advantage, definition, F-126
Mechanical equivalent of heat, definition, F-117
Mechanical properties
  metals and alloys, D-187—188
  plastics, commercial, table, C-781—790
  tensile strength, metals used as conductors, E-85
  whiskers, F-84
Mechanics
  dimensionless groups, F-344
  MKS system of units, F-299
  symbols used in, F-291
  units, conversion factors, F-307—329
Mega, definition, F-117
Megabarye, unit of pressure, definition, F-116
Melting point
  carbohydrates, table, C-761—768
  elements, table, B-2—27
  elements °C, table, D-190
  fats and oils, D-180
  glass sealing and lead wire materials, F-160—161
  index to organic compounds, table, C-645—657
  inorganic compounds, table, B-51—144, 231—235
  low temperature liquid baths, D-224
  metals and alloys, commercial, C-177—178
  metals, mixture, D-186
  organic compounds, table, C-81—548
  organometallic compounds, table, C-686—721
  rare earth metals, table, B-221
  refractory materials, table, D-51—58
  semiconductors, table, E-102—104
  steroid hormones and synthetics, C-741—756
  waxes, table, C-769
Mendelevium (Md 101)
  atomic number, B-1, 14
  atomic weight, B-14
  electronic configuration, B-1
  history, B-14
  production, general methods, B-14
  properties in general, B-14
  properties, specific, see under Elements
  symbol, B-14
  valence, B-14
Mercury (Hg 80)
  atomic number, B-1, 14
  atomic weight, B-14
  boiling point, B-14
  compressibility, isothermal, of liquid, F-17
  density and volume — 10°C to 360°C, F-6
  electronic configuration, B-1
  gravimetric factors, logs of, B-163
  heat capacity, D-175
  history, B-14
  line spectra of, E-276—277
  melting point, B-14
  production, general methods, B-14
  properties in general, B-14
  properties, specific, see under Elements, Inorganic compounds, Metals
  specific gravity, B-14
  symbol, B-14
  uses, B-14
  valence, B-14
Mercury, planet, physical data for, F-176—187
Merkel number, definition, F-338
Meson, definition, F-117
Meson table, F-272—276
Metallic elements, definition, F-117
Metallic hydrogen, B-11
Metals, see also Alloys, Elements, Inorganic compounds
  absorption coefficient of solar radiation, for several, E-392—393
  alkali, electrical resistivity, table, F-172
  alloys, low melting points, composition, F-24
  alloys, magnetic, properties of, E-117—120
  atomic heat of tungsten, E-394
  boiling point, pure metals, D-189
  conductors, properties of, E-85
  Debye—Sommerfield equation, constants for some substances, D-185
  diffusion data, radioactive tracers, metals into metals, F-63—71
  elasticity, modules, of commercial, D-187—188
  electron emmission of tungsten, table, E-394
  emissivity of, 392—393
  spectral, oxidized and unoxidized metals, E-394
  total, of several at low temperatures, E-392—393
  total, of some metals and alloys, E-392—393
    tungsten, tables, E-381, 394
  enthalpy, low temperatures, table, D-183—185
  evaporation of tungsten, table, E-394
  friction, coefficient of
    kinetic, for brass on ice, F-23
    static, for steel and several other metals, F-21—23
  glass sealing and lead wire materials composition and physical properties, F-160—161
  hardness data for several, F-24
  heat of fusion, latent, pure metals, table, D-189
  hydrogen, metallic form thought possible, B-11
  linear expansion, coefficient
    commercial, table, D-187—188
    pure, table, D-189
  melting point, approximate, of commercial, D-187—188
  melting points of conductors, E-85
  melting points of mixtures of, D-186
  platinum wire, mass of, F-164
  properties, misc. of commercial, D-187—188
  reflection coefficient of some, E-392—393
  resistivity, electrical, of commercial, D-187—188
  resistivity of tungsten, table, E-394
  solders, properties, tables, F-172—174
  specific gravity of commercial, D-187—188
  specific heat
  elements at 25°C, table, D-181—182
    low temperatures, D-183—185
  pure, table, D-189
  steel, composition, standard types of stainless and heat resisting, F-157—158
  steel, transformer, permeability, E-122
  superconductive, high critical magnetic-field, critical temperature, E-99—100
  superconductive compounds and alloys, critical field data, E-98
  superconductive compounds and alloys critical temperature and crystal structures, E-88—98

Newton's law of cooling, F-118
Newton's law of motion, F-118
Newton number, definition, F-338
Newtonian speed of sound, definition and equation, F-118
Newtonian telescope, definition, F-118
Newtons, conversion factors for, F-323
Nickel (Ni 28)
  atomic number, B-1, 15
  atomic weight, B-15
  boiling point, B-15
  electronic configuration, B-1
  gravimetric factors, logs of, B-164
  history, B-15
  line spectra of, E-283—284
  melting point, B-15
  production, general methods, B-15
  properties in general, B-15
  properties, specific, see under Elements, Inorganic compounds, Metals
  specific gravity, B-15
  symbol, B-15
  transition probabilities, E-369—370
  uses, B-15
  valence, B-15
Nickel sulfate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-247
Niobium (Nb 41)
  atomic number, B-1, 15
  atomic weight, B-15
  boiling point, B-15
  electronic configuration, B-1
  gravimetric factors, logs of, B-158
  history, B-15
  line spectra of, E-284—286
  melting point, B-15
  price, approximate, B-15
  production, general methods, B-15
  properties in general, B-15

  - altitude of an isosynchronous satellite, F-178
  - aphelion, F-177
  - atmospheric composition, F-181
  - average solar day, F-178
  - average synodic period, F-181
  - average temperatures, F-181
  - centrifugal force at equator, F-178
  - density, g/cc, F-176
  - density, compared to Earth's, F-183
  - eccentricity, F-177
  - ellipse transfer data, Hohmann, F-188
  - ellipticity, F-176
  - equatorial rotation period, F-178
  - escape velocity, F-180
  - escape velocity, mean, F-187
  - escape velocity, solar, F-187
  - gravitational constant, F-183
  - gravitational constant in Earth units, F-183
  - gravity, F-180
  - gravity, compared to Earth's, F-185
  - Hohmann ellipse transfer data, F-188—191
  - inclination of equator to ecliptic, F-181
  - inclination of equator to orbit, F-181
  - inclination of orbit to ecliptic, F-181
  - inclination of orbit to equator of primary, F-181
  - inclination of orbit to orbit of primary, F-181
  - isosynchronous satellite data, F-187
  - Kepler's laws, F-113
  - longitude of ascending node, F-177

  longitude of perhelion, F-177
  mass, equation, F-130
  mass, kg, F-176
  mass, compared to Earth's, F-183
  orbital velocity, F-180
  orbital velocity, mean, F-187
  perhelion, F-177
  period of revolution, compared to Earth's, F-185
  period of rotation, compared to Earth's, F-183
  radius, F-176
  radius of body, compared to Earth's, F-183
  radius of orbit, compared to Earth's, F-185
  rotational velocity, mean, F-187
  rotational velocity at equator, F-178
  semimajor axis of revolution, F-177
  sidereal period of revolution, F-178
  solar constant, F-181
  surface pressure, F-181
  symbol, F-187
  temperature, average, F-181
  velocity, compared to Earth's, F-185
  volume, compared to Earth's, F-185
Plant oils, see Fats and oils
Plasma, see also Serum, definition, F-121
Plasticity number, definition, F-342
Plastics, see also Organic compounds
  ASTM, applicable specifications and test methods, commercial, table, C-781—790
  chemical resistance of commercial, table, C-781—790
  color of commercial, table, C-781—790
  composition, C-773—779
  dielectric constants, tables, E-60
  electrical properties of commercial, table, C-781—790
  fabrication methods of commercial, table, C-781—790
  friction, coefficient of static, F-21, 23
  manufacturers, C-773—779
  mass attenuation coefficients, E-144—145
  mechanical properties of commercial, table, C-781—790
  refractive index of commercial, table, C-781—790
  thermal properties of commercial, table, C-781—790
  trade names, C-773—779
Platinum (Pt 78)
  atomic number, B-1, 17
  atomic weight, B-17
  boiling point, B-17
  electronic configuration, B-1
  gravimetric factors, logs of, B-167
  history, B-17
  line spectra of, E-292—293
  melting point, B-17
  price, approximate, B-17
  production, general methods, B-17
  properties in general, B-17
  properties, specific, see under Elements, Inorganic compounds, Metals
  specific gravity, B-17
  symbol, B-17
  uses, B-17
  valence, B-17
  wire table, F-164
Pluto, physical data for, F-176—177
Plutonium (Pu 94)
  atomic number, B-1, 17
  atomic weight, B-17
  boiling point, B-17
  definition, F-121
  electronic configuration, B-1
  history, B-17
  line spectra of, E-293
  melting point, B-17
  price, approximate, B-17
  production, general methods, B-17
  properties in general, B-17
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-17
  symbol, B-17
  uses, B-17
  valence, B-17
Points (printers), conversion factors for, F-324
Poise, definition, F-121, 131
Poiseville flow, definition and equation, F-121
Poiseville number, definition, F-338
Poisson constant, definition, F-121
Poisson distribution, definition and equation, F-121
Poisson's ratio, definition, F-121
Polarization, circular, definition, F-97
Polarized light, definition, F-121
Polarizing angle, definition, F-95
Polonium (Po 84)
  atomic number, B-1, 17
  atomic weight, B-17
  boiling point, B-17
  electronic configuration, B-1
  history, B-17
  line spectra of, E-293—294
  melting point, B-17
  production, general methods, B-17—18
  properties in general, B-17—18
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-17
  symbol, B-17
  toxicity, B-18
  uses, B-17—18
  valence, B-17
Polyatomic group in naming compounds, B-31—34
Polyatomic molecules, bond strengths, F-231—237
Polycyclic hydrocarbons, fused, rules for naming, C-11—18
Polygon of forces, definition, F-130
Polymorphism, definition, F-121
Polymorphism in naming crystals, B-47
Pomerantsen number, definition, F-338
Porcelain enamel, reflection coefficient, E-392—393
Positron, definition, F-121
Posnov number, definition, F-338
Potassium (K 19)
  atomic number, B-1, 18
  atomic weight, B-18
  boiling point, B-18
  electronic configuration, B-1
  gravimetric factors, logs of, B-167—170
  history, B-18

  line spectra of, E-294—295
  melting point, B-18
  price, approximate, B-18
  production, general methods, B-18
  properties in general, B-18
  properties, specific, see under Elements, Inorganic compounds, Metals
  specific gravity, B-18
  symbol, B-18
  transition probabilities, E-363
  uses, B-18
  valence, B-18
Potassium bicarbonate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-249
Potassium biphthalate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-249
Potassium bromide, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-250
Potassium carbonate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-250
Potassium chloride, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-251
Potassium chromate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-251
Potassium dichromate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-251—252
Potassium ferricyanide, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-252
Potassium ferrocyanide, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-252—253
Potassium hydroxide, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-253
Potassium iodide, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-253—254
Potassium nitrate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-254
Potassium oxalate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-254
Potassium permanganate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-255
Potassium phosphate, dihydrogen (monobasic), see also Inorganic compounds
  concentrative properties of, in varying concentration, D-255
Potassium phosphate, monohydrogen (dibasic), see also Inorganic compounds
  concentrative properties of, in varying concentration, D-255
Potassium sulfate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-256—257
Potassium thiocyanate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-257
Potential (electric), definition and equation, F-103, 121
Potential energy, definition and equation, F-121
Potential index of refraction, definition, F-121
Pound, defined value, F-329
Pound, definition, F-121
Pound, unit of mass, definition, F-121
Poundal, unit of force, definition, F-107, 121
Power, definition and equation, F-122
Power developed by a direct current, equations, F-122
Power factor, equation, F-122
Power in watts for alternating current, equation, F-122
Power number, definition, F-338
Power number, modified, definition, F-342
Power ratios, definition, F-122
Prandtl number
  air, 300°K to 2800°K at 20, 30, and 40 atm., F-13—15
  dimensionless number, definition, F-338
  magnetic, definition, F-338
  oxygen, liquid and gaseous, F-81
  total, definition, F-342
  turbulent, definition, F-342
Prandtl velocity ratio, definition, F-338
Praseodymium (Pr 59)
  atomic number, B-1, 18
  atomic weight, B-18
  boiling point, B-18
  electronic configuration, B-1
  gravimetric factors, logs of, B-170
  history, B-18
  line spectra of, E-295—299
  melting point, B-18
  price, approximate, B-18
  production, general methods, B-18
  properties in general, B-18
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-18
  symbol, B-18
  uses, B-18
  valence, B-18
Precipitation value, see Solubility product
Predvoditelev number, definition, F-338
Predvoditelev number (mass transfer), definition, F-343
Prefix names, list of substituents, C-46—55
Prefixes, rules for use, in physics, F-287
Pressure
  change with altitude in standard atmosphere, graph, F-209
  definition, F-122
  versus altitude, graph, F-209
Pressure, absolute
  ammonia, saturated vapor, −60°F to 124°F, E-27—28
  carbon dioxide, saturated vapor, −20°F to 88°F, E-29
  definition, F-122
  mercury, saturated vapor, 402°F to 1000°F, E-33
  organic compounds, several, E-31—33
  sulfur dioxide, saturated vapor, −40°F to 100°F, E-30
Pressure, critical, see Critical pressure

Pressure, dynamic, definition, F-102
Pressure, gauge, definition, F-122
Pressure, partial, definition, F-120
Pressure, standard, correction of boiling points to, D-192
Pressure, vapor, see Vapor pressure
Pressure number, definition, F-338
Prices, approximate, chemical elements, B-2—27
Primary colors, definition, F-122
Principal focus, definition, F-122
Principle of least time, Fermat's, F-106
Prism, index of refraction by minimum deviation, equation, F-111
Probability function, normal, A-127
Procaine hydrochloride, see also Organic compounds
  concentrative properties of, in varying concentration, D-256
Progestins
  formulae, chemical, C-752—755
  properties, C-752—755
  uses, C-739—740
Progestogens
  formulae, chemical, C-752—755
  properties, C-752—755
  uses, C-739
Projectiles, equations, F-122
Promethium (Pm 61)
  atomic number, B-1, 18
  atomic weight, B-18
  boiling point, B-18
  electronic configuration, B-1
  history, B-18
  line spectra of, E-299
  melting point, B-18
  production, general methods, B-18
  properties in general, B-18
  properties, specific, see under Elements, Inorganic compounds, Rare earth metals
  price, approximate, B-18
  symbol, B-18
  uses, B-18
  valence, B-18
1-Propanol, see also Organic compounds
  concentrative properties of, in varying concentration, D-257
2-propanol, see also Organic compounds
  concentrative properties of, in varying concentration, D-257
Proplyene glycol, see also Organic compounds
  concentrative properties of, in varying concentration, D-258
Protactinium (Pa 91)
  atomic number, B-1, 18
  atomic weight, B-18
  electronic configuration, B-1
  history, B-18
  line spectra of, E-300
  melting point, B-18
  price, approximate, B-18—19
  production, general methods, B-18
  properties in general, B-18—19
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-18
  symbol, B-18
  uses, B-18—19
  valence, B-18
Protein
  animal, mass attenuation coefficients, E-146
  concentrative properties, serum or plasma, D-259
Proton, definition, F-122
Proton Compton wavelength, value, F-245
Proton mass to electron mass, ratio, F-244
Proton moment in nuclear magnetons, value, F-245
Proton-proton reaction, definition, F-122
Proton rest mass, value, F-244
Proton storm, definition, F-122
Psychrometric observation, reduction of, wet and dry bulb thermometer, E-45
Psychrometric ratio, definition, F-338
P-10, mass attenuation coefficient for, E-146
Pulsation number, definition, F-343
Pulsed laser,definition, F-122
Puncheons, conversion factors for, F-325
Purkinje effect, definition, F-122
Pyranometer, definition, F-91
Pyrgeometer, definition, F-91
Pyrheliometer, definition, F-91
Pyron, definition, F-122

Q

Q gas, mass attenuation coefficient for, E-146
Quadrants, conversion factors for, F-325
Quantities, complex, recommended symbols for, in physics, F-297
Quantities, dimensionless groups involving, F-330—347
Quantities, units of, conversion factors, F-307—329
Quantities and units, definitions and equations, F-90—132
Quantity of charge, definition, F-122
Quantity of electricity, definition and equation, F-122
Quantity of sound, definition, F-122
Quantum, definition, F-122
Quantum mechanics, symbols used, F-294
Quantum of action, value, F-91
Quantum of circulation, value, F-244
Quantum states, symbols, units and nomenclature, F-289
Quantum theory, definition, F-122
Quarterns, conversion factors for, F-325
Quarters, conversion factors for, F-325
Quartz, clear fused, see also Inorganic compounds, Minerals
  constants, physical, table of, F-80
Quasi-monochromatic, definition, F-122
Quintals, conversion factors for, F-325

R

Rad, definition, F-122
Radar, absorption, cross sections, definition, F-90, 122
Radar nautical mile, definition, F-123
Radial frequency parameter, definition, F-343

Radian, unit of angle, definition, F-92, 123
Radiance
  defining equation for, E-215
  symbols and units for, E-215
Radians, angles in, natural trigonometric functions, secants and cosecants, A-26
Radians, angles in π, natural trigonometric functions, sine, tangent, cotangent, cosine, A-27
Radians, angles in natural trigonometric functions, A-24—25
Radians, π, special multiples of, sine and cosine functions A-28
Radians—degrees, conversion table, A-30
Radians—degrees—mils, conversion table, A-30
Radians to degrees, minutes, and seconds, conversion table, A-30
Radiant density
  defining equation for, E-215
  symbols and units for, E-215
Radiant energy, symbols and units used for, E-215
Radiant exitance
  defining equation for, E-215
  symbols and units for, E-215
Radiant flux, defining equation for, E-215
Radiant intensity
  defining equation for, E-215
  symbols and units for, E-215
Radiation
  atmospheric, definition, F-93
  definition, F-123
  electromagnetic, definition, F-103
  extraterrestrial, definition, F-106
  from ideal black body, 100°K—6000°K, E-390—391
  global, definition, F-109
  infrared, definition, F-112
  intensity of, definition, F-112
  ionizing, definition, F-113
  Kirchoff's law, F-114
  laws, definition, F-123
  light, symbols used, F-293
  solar, direct, definition, F-101
  solar, total monthly in a cloudless sky, F-202—203
  terrestrial, definition, F-128
Stefan-Boltzmann law, F-127
Radiation Chemistry Data Center, publications, F-369
Radiation constant
  first value, F-245
  second, value, F-245
Radiation formula, Planck's, F-121
Radiation from radioactive materials, recommended permissible exposure to, B-379—387
Radiation number, definition, F-338
Radiative transition probabilities
  K X-ray lines, E-203
  L X-ray lines, E-204
Radicals
  determination of selected, by organic analytical reagents, D-140—143
  electrochemical series, D-155—160
    electron affinities, E-67
    equivalent conductances, table, D-169
    inorganic, naming rules, B-34—35
  list for naming inorganic and organic compounds, B-48
  organic
    naming of, C-1—42
    naming rules vs. inorganic rules, B-35
    prefix names, C-46—55
  solubility chart of salts, D-145—146
Radicals, free, heats of formation, table, F-238—241
Radii, crystal ionic, of the elements, F-214—215
Radii in A, Van der Waal's, D-194
Radioactive isotopes, see radionuclides
Radioactive nuclides, definition, F-123
Radioactive tracer diffusion data for pure metals, F-63—71
Radioactivity, definition, F-123
Radiometer, definition, F-123
Radiometry, symbols, equations, units, E-215
Radionuclides, see also Isotopes
  gamma energies, table, B-322—377
  gamma intensities, table, B-322—377
  half-life, table, B-378—386
  human intake, permissible quarterly levels, B-378—386
Radium (Ra 88)
  atomic number, B-1, 19
  atomic weight, B-19
  boiling point, B-19
  electronic configuration, B-1
  history, B-19
  line spectra of, E-300
  melting point, B-19
  production, general methods, B-19
  properties in general, B-19
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-19
  symbol, B-19
  toxicity, B-19
  uses, B-19
  valence, B-19
Radius, average, of ion atmosphere, definition, F-129
Radius, Earth, at equator, F-193
Radius, planets, satellites and the sun, F-176
Radius of gyration, definition, F-123
Radius of orbit, planets, satellites, and the sun, F-185
Radius of Sun and planets compared to Earth's, F-183
Radon (Rn 86)
  atomic number, B-1, 19
  atomic weight, B-19
  boiling point, B-19
  density, B-19
  electronic configuration, B-1
  history, B-19
  line spectra of, E-300
  melting point, B-19
  price, approximate, B-19
  production, general methods, B-19
  properties in general, B-19
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-19
  symbol, B-19
  uses, B-19
  valence, B-19

Rainbows, angular radius of, F-211
Raman scattering, definition, F-123
Raman spectra, projects yielding data, F-356
Ramzin number, definition, F-338
Rankine scale of temperature, definition, F-123
Raoult's law, F-123
Rare earth metals, see also Inorganic compounds, Elements
  allotropic form data, table, B-222
  atomic volume, table, B-222
  boiling point, table, B-221
  compressibility, table, B-221
  crystal structure, table, B-222
  density, table, B-221
  heat of vaporization, table, B-221
  melting point, table, B-221
  metallic radius, table, B-221
  resistivity
    electrical, polycrystalline wire, table, B-221
    residual wire, table, B-221
Rayleigh number, definition, F-123, 338
Rayleigh scattering, definition, F-123
Reagents
  deci-normal solution of selected
    atomic or molecular weight, D-138—139
    hydrogen equivalent, D-138—139
    0.1 hydrogen equivalent in g, D-138—139
    oxidation and reduction, D-139
  organic analytical, applications of, table, D-140—143
  preparation of, D-130—137
Real image, definition, F-123
Reaumur degree, definition, F-128
Recoil effect, Compton, see Compton recoil effect
Recovery factor, definition, F-339
Reduction, definition, F-123
Reduction potentials, electrochemical series, D-155—160
Reduction reagents, equivalent weight of various, D-139
Redwood seconds, conversion from cnetistokes, table, F-49
Reech number, definition, F-339
Reference temperatures certain, F-112
Reflectance
  defining equations for, E-216
  symbols and unit for, E-216
Reflecting telescope, definition, F-123
Reflection, coefficient of
  definition, F-123
  miscellaneous surfaces, tables, E-392—393
Reflection, diffuse, definition, F-101
Reflection of light by a transparent medium in air, equation, F-123
Reflectivity, definition, F-123
Refracting telescope, definition, F-123
Refraction, definition, F-123
Refraction, index of, see Index of refraction
Refraction, molar
  calculation method for organic compounds, E-386
  definition, E-386
Refraction, Snell's law of, F-126
Refraction, specific, conversion to, D-227
Refraction at a spherical surface, definition, F-123
Refractive index, see also Index of refraction
  aqueous solutions, E-387
  fluorocarbon refrigerants, E-34—35
  pigments, paint, F-85—87
Refractivity, formula for, F-123—124
Refractivity, relative specific
  inorganic compounds, selected, D-229—276
  organic compounds, selected, D-229—276
Refractory materials, properties of, tables, D-51—58
Refrigerants, see also Organic compounds, Inorganic compounds, Gases
  common, miscellaneous properties of, E-37
  fluorocarbon, physical properties, including toxicity, E-34—35
  hazard, life, Underwriters' Laboratories' classification for, E-36
  thermodynamic properties of some, E-27—33
Relation of angular functions in terms of one another, A-29
Relative biological effectiveness, definition, F-124
Relative humidity
  definition, F-124
  dew-point table, E-44
  from wet and dry bulb thermometer, E-45
  sulfuric acid solutions, E-46
Relativistic mass equation, definition, F-124
Relativistic particle, definition, F-124
Relativistic velocity, definition, F-124
Relaxation-field effect, definition, F-124
Reluctance, definition, F-124
Reluctivity, definition, F-124
Rem, definition, F-124
Remanence of magnetic alloys, E-117—118, 122
Repulsion, interionic, definition, F-112
Resins, ionic exchange, properties, table, C-791—793
Resistance
  aluminum wire, table, F-166
  conductors, equations, F-124
  definition, F-124
  electrical fair-weather atmosphere, F-212
  specific, definition, F-124
  standard annealed copper wire, tables, F-164—166
  wires, tables for several metals, F-168—170
Resistance coefficient, definition, F-339
Resistance group, hydraulic, definition, F-342
Resistivity
  definition and equation, F-124
  metals used as conductors, E-85
  residual, rare earth metals, wire, B-221
  tungsten, table, E-394
Resistivity, electrical
  alkali metals, F-172
  elements, table of values, F-171—172
  glass sealing and lead wire materials, F-160—161
  metals and alloys, commercial, table, D-187—188
  rare earth metals, polycrystalline wire, B-221
  refractory materials, table, D-52—58
  sodium and Na-K alloys, F-83
Resistors, color code marking for composition type and wire wound type, F-170
Resolving power of a telescope or microscope, definition, F-124
Resonance, chemical, definition, F-124

Resonance radiation, definition, F-107
Restitution, coefficient of, see Coefficient of restitution
Rest mass, definition and equation, F-124
Reverberation, definition, F-124
Reversible reaction, definition, F-124
Revolution, period of, planets and their satellites compared to Earth's, F-185
Reynolds number, definition, F-339
Reynolds number, electrical, definition, F-341
Reynolds number, entry, definition, F-335
Reynolds number, magnetic, definition, F-337
Rhenium (Re 75)
  atomic number, B-1, 19
  atomic weight, B-19
  boiling point, B-19
  electronic configuration, B-1
  gravimetric factors, logs of, B-170
  history, B-19
  line spectra of, E-300—302
  melting point, B-19
  price, approximate, B-19
  production, general methods, B-19
  properties in general, B-19
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-19
  symbol, B-19
  uses, B-19
  valence, B19
Rheological properties, dimensionless groups, F-345
Rhodium (Rh 45)
  atomic number, B-1, 19
  atomic weight, B-19
  boiling point, B-19
  electronic configuration, B-1
  gravimetric factors, logs of, B-170
  history, B-19
  line spectra, E-302—303
  melting point, B-19
  price, approximate, B-19
  production, general methods, B-19
  properties in general, B-19
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-19
  symbol, B-19
  uses, B-19
  valence, B-19
Richardson number, definition, F-339
Rigidity, modulus of, equation, F-103
Ring assemblies, hydrocarbon, nomenclature, C-26—28
Ring compounds, organic, numbering system, list, C-56—58
Rochon prism, definition, F-124
Rocks
  chemical composition, F-200
  heat capacity, E-16
  heat capacity, rock forming minerals, B-219
  geologic time scale, F-199
  lunar, brief description, B-3
  thermal conductivity, E-16
Roentgen, definition, F-125
Roentgen equivalent man, definition, F-125
Roentgen equivalent physical, definition, F-125
Romankov number, definition, F-339
Roods, conversion factors for, F-326
Root-mean-square error, definition, F-125
Ropes, conversion factors for, F-326
Rossby number, definition, F-339, 343
Rotary power, atomic, definition, F-125
Rotation, optical, see Optical Rotation
Rotation, period of, planets, satellites and the sun, F-178
Rotation, period of, planets, their satellites compared to Earth's, F-183
Rotation, specific, see Specific rotation
Rotational velocity of Earth, F-193
Rotatory power, definition, F-125
Rotatory power, magnetic, organic compounds, E-413—415
Roughness factor, definition, F-339
Rubber
  densities of soft commercial and pure gum, F-1
  dielectric constants, E-60
  friction, coefficient of static, F-21
  velocity of sound, E-47
Rubidium (Rb 37)
  atomic number, B-1, 19
  atomic weight, B-19
  boiling point, B-19
  electronic configuration, B-1
  gravimetric factors, logs of, B-170—171
  history, B-19
  line spectra of, E-303—305
  melting point, B-19
  price, approximate, B-20
  production, general methods, B-19—20
  properties in general, B-19—20
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-19
  symbol, B-19
  uses, B-19—20
  valence, B-19
Russian and Greek alphabet, F-303
Ruthenium (Ru 44)
  atomic number, B-1, 20
  boiling point, B-20
  electronic configuration, B-1
  history, B-20
  line spectra of, E-305—306
  melting point, B-20
  price, approximate, B-20
  production, general methods, B-20
  properties in general, B-20
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-20
  symbol, B-20
  uses, B-20
  valence, B-20
Rutherfordium, see Element 104
Rydberg constant, conversion factor, F-246
Rydberg constant, value, F-244
Rydberg formula, F-125

S

S and O reagent, preparation of, D-136
Saccharometer, Brix or Balling, scale units, F-3
Sadtler Standard Spectra, organic compounds, C-665-685
Salinity, relative, calculation of, D-227
Salts
  definition, F-125
  naming of inorganic, B-40—41
  ternary
    lattice energy, D-98—99
  tetraalkyl ammonium
    lattice energy, D-99—100
Samarium (Sm 62)
  atomic number, B-1, 20
  atomic weight, B-20
  boiling point, B-20
  electronic configuration, B-1
  gravimetric factors, logs of, B-171
  history, B-20
  line spectra of, E-306—307
  melting point, B-20
  price, approximate, B-20
  production, general methods, B-20
  properties in general, B-20
  properties, specific, see under Elements, Inorganic compounds, Rare earth metals
  specific gravity, B-20
  symbol, B-20
  uses, B-20
  valence, B-20
Saponification value
  fats and oils, D-225
  waxes, table, C-769
Sarrau number, definition, F-339
Satellite geodesy, constants, F-192
Satellites of the planets
  albedo, F-181
  altitude of an isosynchronous satellite, F-178
  aphelion, F-177
  atmospheric composition, F-181
  average solar day, F-178
  average synodic period, F-181
  average temperatures, F-181
  centrifugal force at equator, F-178
  density, compared to Earth's, F-183
  density, g/cc, F-176
  eccentricity, F-177
  ellipticity, F-176
  equatorial rotation period, F-178
  escape velocity, F-180
  gravitational constant, F-183
  gravitational constant in Earth units, F-183
  gravity, F-180
  gravity, compared to Earth's, F-185
  inclination of equator to ecliptic, F-181
  inclination of equator to orbit, F-181
  inclination of orbit to ecliptic, F-181
  inclination of orbit to equator of primary, F-181
  inclination of orbit to orbit of primary, F-181
  isosynchronous satellite data, F-187
  longitude of ascending node, F-177
  longitude of perhelion, F-177
  mass, compared to Earth's, F-183
  mass, kg, F-176
  orbital velocity, F-180
  orbital velocity, mean, F-187
  perhelion, F-177
  period of revolution, compared to Earth's, F-185
  period of rotation, compared to Earth's, F-183
  radius, F-176
  radius of body, compared to Earth's, F-183
  radius of orbit, compared to Earth's, F-185
  rotational velocity at equator, F-178
  rotational velocity, mean, F-187
  semimajor axis of revolution, F-177
  sidereal period of revolution, F-178
  solar constant, F-181
  surface pressure, F-181
  symbols, F-187
  synodic period, average, F-181
  temperature, average, F-181
  velocity, compared to Earth's, F-185
  volume, compared to Earth's, F-185
Saturated fatty acids, constituent % in fats and oils, D-226
Saturation constants for magnetic substances, E-122
Saturation constants of ferromagnetic elements, E-121
Saybolt seconds, conversion from centistokes, table, F-49
Scale height, definition and equation, F-125
Scandium (Sc 21)
  atomic number, B-1, 20
  atomic weight, B-20
  boiling point, B-20
  electronic configuration, B-1
  gravimetric factors, logs of, B-171
  history, B-20
  line spectra of, E-307—310
  melting point, B-20
  price, approximate, B-20
  production, general methods, B-20
  properties in general, B-20
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-20
  symbol, B-20
  transition probabilities, E-373—374
  uses, B-20
  valence, B-20
Scattered (light), definition, F-125
Scattering coefficient, definition, F-125
Scattering cross section, definition, F-125
Scheibler's reagent, preparation of, D-136
Schiff's reagent, preparation of, D-136
Schiller number, definition, F-339
Schlieren (photography), definition, F-125
Schmidt number, definition, F-339, 343
Schweitzer's reagent, preparation of, D-136
Scientific or just musical scale, E-48
Scientific terms, abbreviations for, American standard, F-304
Scintillation counter, definition, F-125
Scintillometer, definition, F-125
Scruples, conversion factors for, F-326
Sea-level atmospheric composition for a dry atmosphere, F-206

Sea level correction of barometer readings, E-42—43
Sea water, see Water, sea
Seams, conversion factors for, F-326
Secants and cosecants, natural trigonometric functions for angles in χ radians, A-26
Second, defined value, F-329
Second, definition, F-125
Second, ephemeris, definition, F-105
Second law of thermodynamics, definition, F-125
Second of arc, definition, F-125
Second order equation, linear, method of solution, A-120
Second, unit of time, definition, F-125
Secondary electron emission
  definition, E-343
  elements and compounds, table, E-217—218
Seconds, ephemeris in 1 tropical year (1900), F-192
Seconds and minutes to decimal parts of a degree, conversion table, A-31
Seconds pendulum, length of, F-200
Seconds to radians, conversion table, A-30
Seebeck effect, F-125
Segment, definition, F-127
Seismic waves, velocity, F-204
Selenates, lattice energy, D-97—98
Selenides, lattice energy, D-97
Selenites, lattice energy, D-97
Selenium (Se 34)
  atomic number, B-1, 20
  atomic weight, B-20
  boiling point, B-20
  electronic configuration, B-1
  gravimetric factors, logs of, B-171
  history, B-20
  line spectra of, E-310—311
  melting point, B-20
  price, approximate, B-21
  production, general methods, B-20
  properties in general, B-20—21
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-20
  symbol, B-20
  uses, B-20
  valence, B-20
Self-induction, definition, F-111
Semenov number, definition, F-339, 343
Semiconductors
  conductor bands, data, E-106
  definition, E-101, F-125
  density, table, E-102—104
  density of states, hole and electron effective masses, E-105
  energy gap, minimum, tables, E-102—105
  heat of formation, table, E-102—104
  lattice parameters, table, E-102—104
  melting point, table, E-102—104
  mobility of electrons, tables, E-102—105
  mobility of holes, tables, E-102—105
  thermal conductivity, table, E-102—104
  valence bands, data, E-106
Senftleben number, definition, F-339
Sensitiveness of a balance, definition, F-125
Separation of variables, method of solution, A-120
Serum or plasma
  concentrative properties of, in varying concentration in aqueous solution
  human, D-258—259
  rabbit or guinea pig, D-259
Sferics, etc., description, F-213
Shear strength, definition, F-125
Shell, electron, definition, F-125
Sherwood number, definition, F-339
Sidereal day, definition, F-125
Sidereal month, definition, F-126
Sideral period of revolution, planets and their satellites, F-178
Sidereal time, definition, F-126
Sidereal year, definition, F-126
Siemen's units, conversion factors for, F-326
Sieves, standard test, wire cloth, opening sizes and wire diameter, F-159
Silicon (Si 14)
  atomic number, B-1, 21
  atomic weight, B-21
  boiling point, B-21
  electronic configuration, B-1
  gravimetric factors, logs of, B-171
  history, B-21
  line spectra of, E-311—313
  melting point, B-21
  price, approximate, B-21
  production, general methods, B-21
  properties in general, B-21
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-21
  symbol, B-21
  transition probabilities, E-374—375
  uses, B-21
  valence, B-21
Silver (Ag 47)
  atomic number, B-1, 21
  atomic weight, B-21
  boiling point, B-21
  electronic configuration, B-1
  gravimetric factors, logs of, B-171—172
  history, B-21
  line spectra of, E-313
  melting point, B-21
  price, approximate, B-21
  production, general methods, B-21
  properties in general, B-21
  properties, specific, see under Elements, Inorganic compounds, Metals
  specific gravity, B-21
  symbol, B-21
  uses, B-21
  valence, B-21
Silver nitrate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-259
Simple harmonic motion, definition and equations, F-126
Simple machine, definition and equations, F-126
Sine and cosine functions for special multiples of π radians, A-28
Sine, cosine, tangent, cotangent for angles in χ radians,

natural trigonometric functions, A-24—25
Sine, tangent, cotangent, cosine for angles in π radians, natural trigonometric functions, A-27
Sine parallax for Moon, constant, F-192
Skeins, conversion factors for, F-326
Ski wax and ski lacquer, coefficient of static friction on snow, F-23
Sky, luminance, average value, E-213
Sky radiation, diffuse, definition, F-101
Slugs, conversion factors for, F-326
Smoluchowski number, definition, F-343
Snell's law of refraction, F-126
Snow, coefficient of friction for materials on, F-23
Soap solution (reagent), preparation of, D-136
Sodium (Na 11)
  atomic number, B-1, 21
  atomic weight, B-21
  boiling point, B-21
  electronic configuration, B-1
  gravimetric factors, logs of, B-172—175
  history, B-21
  line spectra of, E-313—315
  melting point, B-21
  price, approximate, B-21
  production, general methods, B-21
  properties in general, B-21
  properties, specific, see under Elements, Inorganic compounds, Metals
  specific gravity, B-21
  symbol, B-21
  transition probabilities, E-367
  uses, B-21
  valence, B-21
Sodium acetate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-260
Sodium bicarbonate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-260
Sodium bromide, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-260—261
Sodium carbonate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-261
Sodium chloride, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-261—262
Sodium citrate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-263
Sodium diatrizoate
  concentrative properties of, in varying concentration, D-263
Sodium dichromate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-264
Sodium ferrocyanide, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-264
Sodium hydroxide, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-265
Sodium molybdate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-265
Sodium nitrate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-265—266
Sodium phosphate (tribasic), see also Inorganic compounds
  concentrative properties of, in varying concentration, D-266
Sodium phosophate, dihydrogen (monobasic), see also Inorganic compounds
  concentrative properties of, in varying concentration, D-266
Sodium phosphate, monohydrogen (dibasic)
  concentrative properties of, in varying concentration, D-267
Sodium sulfate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-267
Sodium tartrate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-267
Sodium thiocyanate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-268
Sodium thiosulfate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-268
Sodium tungstate, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-269
Solar constant
  definition, F-126
  numerical value, F-201
  planets, their satellites, Suns and some asteroids, F-181
Solar parallax, constant, F-192
Solar radiation, coefficient of absorption, for various substances, E-392—393
Solar radiation, direct, definition, F-101
Solar radiation in cloudless sky, total monthly, F-202—203
Solar spectral irradiance — proposed standard curve, F-201
Solar system
  data for planets, their satellites, the Sun and some asteroids, F-176—187
  Hohmann ellipse transfer data, F-188—191
Solar wind, definition, F-126
Solders, brazing filler metals
  brazing temperature range, F-173—174
  liquidus temperature, F-173—174
  solidus temperature, F-173—174
Solders, low melting point, liquidus temperature, F-172
Solid, definition, F-126
Solid angle, definition, F-126
Solid state physics, see Physics, solid state
Solubility
  amino acids in various solvents, C-759—760
  definition, F-126
  inorganic compounds, table, B-51—144
  organic compounds in various solvents, table, C-81—548

  organometallic compounds, table, C-686—721
  salts, chart of solubility in selected solvents, D-145—146
Solubility parameters of organic compounds, discussion and tables, C-732—735
Solubility, product
  definition, F-126
  inorganic compounds, table, B-220
Solute, definition, F-126
Solution, heat of, selected compounds, D-118
Solution, saturated, definition, F-126
Solution, true, definition, F-126
Solutions, special, and reagents, preparation of, D-130—137
Solvent, definition, F-126
Sommerfeld number, definition, F-339
Sone, definition, F-126
Sonnenschein's reagent, preparation of, D-135
Soret number, definition, F-343
Sound
  absorption, still air, at 20°C and varying humidity, E-49—53
  intensity of, definition, F-112
  loudness, definition, F-115
  musical scales, E-48
  pitch, definition, F-121
  quality, definition, F-122
  speed, change with altitude in standard atmosphere, graph, F-210
  timbre, definition, F-122
  velocity
    air, dry, E-54
    air, still, at 20°C and varying humidity, E-49—53
    Earth's atmosphere to 160 km, F-204
    gases and vapors, various, table, E-47
    liquids, various, table, E-47
    oxygen, liquid and gaseous, F-81
    quartz, clear fused, F-80
    solids, various, table, E-47
    speed of, definition and equation, F-127
    variation with humidity, equation, F-131
    variation with temperature, equation, F-131
    water above 212°F, E-47—48
Sound, Laplacian, speed of, definition and equation, F-114
Sound, Newtonian, speed of, definition and equation, F-127
Soxhlets lactometer, scale units, F-3
Space (entire), conversion factors for, F-326
Space and time, symbols used to define, F-291
Spalding function, definition, F-339
Spalding number, definition, F-343
Spans, conversion factors for, F-326
Spark-gap voltages, E-55
Spatial frequency plane, definition, F-126
Specific cohesion, see Capillary constant
Specific conductance, definition, F-126
Specific conductance, electrical
  inorganic substances, selected, varying concentration in aqueous solution, table, D-229—276
  organic substances, selected, varying concentration in aqueous solution, table, D-229—276
Specific gravity
  amino acids, crystalline, table, C-760
  azeotropes, tables, D-1—44
  bases, some inorganic, D-169
  conversion to, from density, D-227
  definition, F-126
  elements, liquid state, tables, B-223—225, 228—230
  fats and oils, D-225
  inorganic acids, several, D-168
  inorganic compounds, table, B-51—144
  inorganic substances, selected, varying concentration in aqueous solution, table, D-229—276
  magnetic alloys, E-118—120
  metals and alloys, commercial, table, D-187—188
  metals used as conductors, E-85
  minerals, table, B-181—185
  organic compounds, table, C-81—548
  organic substances, selected, varying concentration in aqueous solution, table, D-229—276
  organometallic compounds, table, C-686—721
  pigments, paint, F-85—87
  rare earth metals, table, B-221
  sugar, invert, aqueous solutions, D-282
  sulfuric acid, aqueous 1%—100% solutions, table, F-7
  waxes, table, C-780
  whiskers, mechanical and physical properties, F-84
Specific heat, E-34—35
  air, 300°K to 2800°K at 20, 30 and 40 Atm., F-13—15
  Black's ice calorimeter, equation, F-127
  Bunsen's ice calorimeter, equation, F-127
  definition, F-126—127
  elements at 25°C, table, D-181—182
  fluorocarbon refirgerants, E-34—35
  glass sealing and lead wire materials, F-160—161
  ice, table, D-175
  mercury, table, D-175
  metals and other solids at low temperatures, D-183—185
  method of mixtures, equation, F-127
  saturated steam and saturated water at constant pressure (steam tables), E-24—25
  steam, super heated, D-175
  water, D-174—175
Specific heat at constant pressure, conversion factors from cgs units to SI and English units, F-12
Specific inductive capacity, definition, F-127
Specific refractivity, equation, F-124
Specific reluctance, definition, F-124
Specific rotation
  amino acids, table, C-758
  carbohydrates, table, C-761—768
  definition, F-127
  organic compounds, several, E-412
  organic compounds, table, C-81—548
  quartz, E-412
  steroid hormones and synthetics, C-741—758
  sucrose in water, E-412
  sugars, several, E-412
Specific volume
  ammonia, saturated vapor, −60°F to 124°F, E-27—28
  carbon dioxide, saturated vapor, −20°F to 88°F, E-29
  definition, F-127
  mercury, saturated, vapor, 402°F to 1000°F, E-33
  organic compounds, several, E-31—33
  sulfur dioxide, saturated vapor, −40°F to 100°F, E-30
  water, ordinary, −20°C to 150°C, F-5—6

Spectra, sources yielding critical data, F-354—357
Spectra index, organic compounds, Sadtler, C-665—685
Spectra, line, of the elements, E-217—349
Spectral emissivity, see Emissivity, spectral
Spectral irradiance, solar — proposed standard curve, F-201
Spectral series, F-125
  definition, F-127
  Rydberg formula for, F-125
Spectroscope, calibration for wave lengths of various light sources, E-214
Spectroscopic transitions, nomenclature, F-289
Spectroscopy
  atomic, symbols, units and nomenclature, F-289
  molecular, symbols, units and nomenclature, F-289, 295
  nuclear, symbols, units and nomenclature, F-289
Spectrum
  invisible, wave lengths of various radiations in A, E-214
  solar, wave lengths of Fraunhofer lines, E-214
  visible, wave length in A, E-214
Spectrum line, splitting, Stark effect, F-127
Spectrum line, splitting, Zeeman effect, F-132
Specular reflection,definition, F-127
Speed, definition, F-127
Speed, specific, definition, F-339
Speed number, definition, F-339
Speed of light, see Velocity, light
Speed of sound, definition and equation, F-127
Speed of sound versus altitude, graph, F-210
Speed, specific, definition, F-339
Spherical aberration, definition, F-127
Spherical mirrors, equation, F-127
Spin, definition, F-127
Spin, nuclear, see Nuclear spin
Spiro compounds, heterocyclic, nomenclature, rules, C-43—44
Spiro hydrocarbons, nomenclature, C-23—26
Spiro union, definition, C-23
Spontaneous-ignition temperature, definition, F-127
Stable particle table, F-267—272
Stagnation pressure, definition, F-127
Standard
  atmosphere, data, F-205—211
  buffer solutions, properties and pH, D-147—148
  calibration tables for thermocouples, E-107—113
  coordinate system in colorimetry, E-411
  flame, various, E-214
  illuminants in colorimetry, E-411
  observer, determination of, E-411
  photometric, E-214
  test sieves, F-159
  x-ray wavelength, definition and discussion, E-145
Standard reduction potentials, see Electrochemical series
Standing waves, see Stationary waves
Stanton number, definition, F-339
Starch solution, preparation of, D-136
Stark effect, F-127
Stark number, definition, F-343
Statcoulomb, definition, F-127
Static pressure, definition, F-127
Stationary waves, definition, F-127
Statute mile, definition, F-127
Steam, specific heat of super-heated, D-175
Steam table, international, definition of calorie, F-329
Steam tables, E-18—26
Steel, see also Alloys, Metals
  composition of standard stainless and heat resisting, F-157—158
  friction, coefficient of static, F-21—22
  high silicon transformer, magnetic properties, E-122
  transformer steels, magnetic properties, E-122
  wire gauge, F-162
Stefan number, definition, F-339
Stefan-Boltzmann constant, value, F-245
Stefan-Boltzmann law of radiaton, F-127
Steinmetz' equation for hysteresis, F-111
Stelzner method of naming of heterocyclic compounds, C-40—41
Steradian, unit of solid angle, definition, F-127
Stereoscopic image, definition, F-127
Steres, conversion factors for, F-327
Steroid hormones, see also Organic compounds
  classification, C-739
  definition, C-739
  formula, chemical, C-741—756
  physical properties, C-741—756
  uses, C-738
Steroidal synthetics, C-739—756
Stewart number, definition, F-343
Stock's notation for inorganic compounds, B-32
Stoichiometric, definition, F-127
Stoichiometric proportions, denotation in naming compounds, B-31
Stoke, definition, F-131
Stoke's law, F-127—128
Stokes number, definition, F-339, 343
Stones, conversion factors for, F-327
Strain, definition, F-128
Strengths of chemical bonds, F-220—241
Stress, definition, F-128
Strontium (Sr 38)
  atomic number, B-1, 22
  atomic weight, B-22
  boiling point, B-22
  electronic configuration, B-1
  gravimetric factors, logs of, B-175
  history, B-22
  line spectra of, E-315—316
  melting point, B-22
  price, approximate, B-22
  production, general methods, B-22
  properties in general, B-22
  properties, specific, see under Elements, Inorganic compounds, Metals
  specific gravity, B-22
  symbol, B-22
  uses, B-22
  valence, B-22
Strontium chloride, see also Inorganic compounds
  concentrative properties of, in varying concentration, D-269
Strouhal number, definition, F-339
Structural formula
  definition, B-30
  organic compounds, table, C-549—614
Stubs' gauge, wire dimensions, table, F-163

Sublimation data, organic compounds, C-722—723
Subshell, definition, F-128
Substance, amount of, see Mole
Sucrose, see also Carbohydrates, Organic compounds, Sugar
  concentrative properties of, in varying concentration, D-270
  index of refraction at 20°C, table, E-388
  index of refraction, correction table for temperatures other than 20°C, E-388
Sugar, see also Carbohydrates, Organic compounds, Sucrose
  invert, specific gravity of aqueous solutions, D-282
  specific rotation of several types, E-283
Sulfur (S 16)
  atomic number, B-1, 22
  atomic weight, B-22
  boiling point, B-22
  electronic configuration, B-1
  gravimetric factors, logs of, B-175—176
  history, B-22
  line spectra of, E-316—317
  melting point, B-22
  production, general methods, B-22
  properties in general, B-22
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-22
  symbol, B-22
  transition probabilities, E-372—373
  uses, B-22
  valence, B-22
Sulfuric acid, see also Inorganic compounds
  aqueous 1%—100% solutions, specific gravity, table, F-7
  concentrative properties of, in varying concentration, D-271
  fuming, density and composition 0%—100%, F-8
Sulphates, lattice energy, D-98
Sulphides, lattice energy, D-98
Sun
  altitude of an isosynchronous satellite, F-178
  centrifugal force at equator, F-178
  density, F-176
  density, compared to Earth's, F-183
  ellipticity, F-176
  equatorial rotation period, F-178
  gravitational constant, F-183
  gravitational constant in Earth units, F-183
  gravity, F-180
  gravity, compared to Earth, F-185
  inclination of equator to eliptic, F-181
  isosynchronous satellite data, F-187
  luminance, values from Earth's surface, E-213
  mass, F-176
  mass, compared to Earth's, F-183
  mass, equation, F-130
  period of rotation, compared to Earth's, F-183
  radius, F-176
  radius of body, compared to Earth's, F-183
  solar constant, value, F-181
  spectrum, wave length of Fraunhofer lines, E-214
  temperature, equilibrium, F-181
  velocity, escape, F-180
  velocity, escape and rotational compared to Earth, F-185
  velocity, mean escape, F-187
  velocity, mean rotational, F-187
  velocity, orbital, F-180
  velocity, rotational, at equator, F-178
  velocity, solar escape, F-187
  volume, compared to Earth, F-185
Superconductivity, see also Low temperatures
  compounds and alloys, critical temperature and crystal structure, E-88—98
  compounds and alloys, high critical magnetic-field, critical temperatures, E-99—100
  definition, E-86
  description of types, E-86—87
  elements, selected properties of, E-88—89
  elements, thin films of, critical temperatures, E-88
  metallurgical aspects, E-87
Supersonic flow, definition, F-128
Suratman number, definition, F-339
Surface density of electricity, definition, F-128
Surface density of magnetism, definition, F-128
Surface tension
  definition, F-128
  dimensionless groups, F-344
  elements, liquid, table of values, F-25—38
  equation, F-128
  ethyl alcohol in water, F-45
  halogens, liquid, table, F-38
  interfacial, for several systems, F-45
  inorganic solutes in water and in organic solvents, F-43
  interfacial for several liquids, F-45
  liquids, mainly organic, table, F-46—48
  methyl alcohol in water, F-44
  organic compounds in water and inorganic solvents, F-43—44
  water against air, F-45
Surface tension number, definition, F-343
Susceptibility (diamagnetic), of organosilicon compounds, E-137—143
Susceptibility, equation, F-116
Susceptibility (magnetic), definition, F-128
Symbols
  dimensionless groups, F-330—347
  Earth's mass, dimensions and other related quantities, F-193—196
  elements, B-1
  isotopes, B-237—320
  planets, F-187
  photometric quantities, E-215—216
  physics, units and nomenclature, F-285—302
  radiometric quantities, E-215—216
  units of weight and measure, F-285
  used in organic compounds table, C-80
Synonyms
  carbohydrates, table, C-761—770
  index to minerals, B-180
  inorganic compounds, table, B-51—144
  organic compounds, table, C-81—548
  steroid hormones, table, C-741—756

"Synthetic" aperture sidelookiing radar, definition, F-128

T

Tangent, sine, cotangent, cosine for angles in π radians, natural trigonometric functions, A-27
Tangent galvanometer, equation, F-128
Tantalum (Ta 73)
  atomic number, B-1, 22
  atomic weight, B-22
  boiling point, B-22
  electronic configuration, B-1
  gravimetric factors, logs of, B-176
  history, B-22
  line spectra of, E-317—318
  melting point, B-22
  price, approximate, B-22
  production, general methods, B-22
  properties in general, B-22
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-22
  symbol, B-22
  uses, B-22
  valence, B-22
Tartaric acid, see also Organic compounds
  concentrative properties of, in varying concentration, D-272
Taylor number, definition, F-339
Technetium (Tc 43)
  atomic number, B-1, 22
  atomic weight, B-22
  boiling point, B-22
  electronic configuration, B-1
  history, B-22
  line spectra of, E-318—320
  melting point, B-22
  price, approximate, B-22
  production, general methods, B-22
  properties in general, B-22
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-22
  symbol, B-22
  uses, B-22
  valence, B-22
Tektite, definition, F-128
Tellurium (Te 52)
  atomic number, B-1, 22
  atomic weight, B-22
  boiling point, B-22
  electronic configuration, B-1
  gravimetric factors, logs of, B-176
  history, B-22
  lattice energy, D-100
  line spectra of, E-320—321
  melting point, B-22
  price, approximate, B-23
  production, general methods, B-22—23
  properties in general, B-22—23
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-22
  symbol, B-22
  uses, B-23
  valence, B-22
Temperature
  change with altitude in standard atmosphere, graph, F-209
  conversion formulae Celsius to Fahrenheit degrees, F-134
  conversion formulae, degrees Fahrenheit to degrees Celsius, F-134
  conversion table, degrees Celsius to degrees Fahrenheit, F-134—156
  conversion table, degrees Centigrade to degrees Fahrenheit, F-134
  conversion table, degrees Fahrenheit to degrees Celsius, F-134—156
  definition
    Celsius, F-128
    Centigrade, F-128
    Kelvin, F-128
  Earth's atmosphere at elevations up to 160 km, F-204
  equivalent, definition and equations, F-105
  international practical scale-68, primary fixed points, F-133
  molecular-scale temperature, relation, F-205
  night and of day, average, for planets, F-201
  scales
    absolute or thermodynamic, definition, F-128
    Celsius, international practical, reference temperature for, F-112
    fundamental, equation, F-128
    Kelvin, international practical, reference temperature for, F-112
    Rankine, F-123
    Reaumur, F-128
Temperature, low, see Low temperature
Temperature, measurement, thermocouples, see Thermocouples
Temperature coefficient
  elements, table of values, F-171—172
  metals used as conductors, E-85
Temperature correction, barometric readings, see Barometric readings, correction, temperature
Temperature resistance coefficient, definition, F-128
Temperature scale, thermodynamic, definition, F-129
Tensile strength, magnetic alloys, E-118—120
Tension, coefficient of, definition, F-97
Tera, definition, F-128
Terbium (Tb 65)
  atomic number, B-1, 23
  atomic weight, B-23
  boiling point, B-23
  electronic configuration, B-1
  gravimetric factors, logs of, B-176
  history, B-23
  line spectra of, E-321—323
  melting point, B-23
  price, approximate, B-23
  production, general methods, B-23
  properties in general, B-23
  properties, specific, see under Elements, Inorganic compounds, Rare earth metals

  specific gravity, B-23
  symbol, B-23
  uses, B-23
  valence, B-23
Terminal settling, gravitational, of particles, F-283
Ternary salts, lattice energy, D-98—99
Terpene
  hydrocarbon, nomenclature, rules, C-29—32
  radicals, nomenclature, rules, C-32
Terrestrial radiation, definition, F-128
Tests, flame and bead, colors, D-129
Tetraalkyl ammonium salts, lattice energy, D-99—100
Tetracaine hydrochloride, see also Organic compounds
  concentrative properties of, in varying concentration, D-174
Thallium (Tl 81)
  atomic number, B-1, 23
  atomic weight, B-23
  boiling point, B-23
  electronic configuration, B-1
  gravimetric factors, logs of, B-176—177
  history, B-23
  line spectra of, E-323—324
  melting point, B-23
  price, approximate, B-23
  production, general methods, B-23
  properties in general, B-23
  properties, specific, see under Elements, Inorganic compounds
  specific gravity, B-23
  symbol, B-23
  uses, B-23
  valence, B-23
THAM®, see Tris(hydroxymethyl) aminomethane
Thermal capacity, definition, F-129
Thermal capacity of a substance, definition, F-128
Thermal capacity of water, D-174
Thermal conductivity
  air, 300°K to 2800°K at 20, 30 and 40 Atm., F-13—15
  building materials, E-5
  ceramic materials, E-5
  conversion factors for units, E-17
  conversion factors from cgs units to SI and English, F-12
  definition and formula, F-98
  dielectric crystals, E-4
  dimensionless groups, F-341

Transmissibility for radiation of glass, quartz and fluorite, E-410
Transmittance
  colored filters
    Corning, E-396—401
    Wratten, E-240—246

  defining equation for, E-216
  symbol and unit for, E-216
Transmutation, definition, F-130
Transparency, conversion to optical density, table, E-415—417
Transparency for the infra-red of rock salt, sylvine and fluorite, E-410
Transport number, definition, F-130
Transport properties
  air, 300°K to 2800°K at 20, 30 and 40 Atm., F-13—15
  dimensionless groups, F-344
Transuranic elements, definition, F-130
Transverse electromagnetic energy, definition, F-130
Triangle of forces, definition, F-130
Trichloroacetic acid, see also Organic compounds
  concentrative properties of, in varying concentration, D-272
Trichromatic coefficients, definition, E-411
Trigonometric functions, integral forms involving, A-65—77
Trigonometric functions, inverse, integral forms involving, A-77—80
Trigonometric functions, natural, for angles in π radians, sine, tangent, cotangent, cosine, A-27
Trigonometric functions, natural, for angles in χ radians, secants and cosecants, A-26
Trigonometric functions, natural, for angles in χ radians, sine, cosine, tangent, cotangent, table, A-24—25
Trigonometric functions, relation of angular functions in terms of one another, A-29
Trigonometric substitutions, integral forms involving, A-80
Trilinear coordinates, see Trichromatic coefficients
Triple point
  definition, F-130
  elements, low boiling °K, D-190
  oxygen, data, F-81
Tris(hydroxymethyl)aminomethane
  concentrative properties of, in varying concentration, D-305
Tritium, definition, F-130
True solution, definition, F-126
Truncation number, definition, F-340
Tungsten (W 74)
  atomic heat, table, E-394
  atomic number, B-1, 24
  atomic weight, B-24
  boiling point, B-24
  brightness, tables, E-214, 394
  color, temperature, table, E-394
  electron emission, table, E-394
  electronic configuration, B-1
  emmissivity, color, table, E-394
  emissivity, spectral, tables, E-394
  emissivity, table, E-381
  emissivity, total, table, E-394
  evaporation, table, E-394
  gravimetric factors, logs of, B-178
  history, B-24
  line spectra, E-331—333
  melting point, B-24
  price, approximate, B-24
  production, general methods, B-24
  properties in general, B-24
  properties, specific, see under Elements, Inorganic compounds, Metals
  resistivity, table, E-394
  specific gravity, B-24
  symbol, B-24
  thermal expansion, table, E-394
  uses, B-24
  valence, B-24
  vapor pressure, table, E-394
Tungsten carbide, see also Inorganic compounds
  friction, coefficient of, static, F-21
Tungsten wire, brightness of, E-214
Tuns, conversion factors for, F-318
Turmeric paper, preparation of, D-136
Turmeric tincture, preparation of, D-136
Twaddell
  hydrometer, scale units, F-3
  scale and Baume scale, relation to density, hydrometer conversion table, F-4
Twist drill gauge, F-163
Two constants involving the number 2, A-128

U

Uffelmann's reagent, preparation of, D-136
Ultrasound camera, definition, F-130
Ultraviolet filters, Corning, transmission of some, E-396—401
Ultraviolet spectra, main maxima of, C-81—548
Ultraviolet spectra index, Sadtler organic compounds, C-665—685
Uncertainty principle, definition, F-111
Underwriters' Laboratories' classification of comparative life hazard of gases and vapors, E-36
Unified atomic mass unit, definition, F-329
Uniform circular motion, equations, F-130
Uniformly accelerated rectilinear motion, equation, F-130
Unit, definition, F-130
Unit field intensity, definition, F-103
Unit of length, obsolete term, F-114—115
Units
  cgs system, F-298
  concentrative properties, D-227
  conversion factors, master table, F-307—329
  international symbols, F-298
  international system, F-112, 300
  MKS system, F-298
  MKSA system of units, F-299—302
  photometric quantities, E-215—216
  radiometric quantities, E-215—216
  rules for use, in physics, F-287
  standard, defined values of some, F-329
  weight and measure
    abbreviations of commonly used, F-296
    spelling and symbols, F-285
    X, definition, F-132
Universal time, definition, F-130
Unsaturated fatty acids, constituent % in fats and oils, D-226
Uranium (U 92)
  atomic number, B-1, 24

  - atomic weight, B-24
  - boiling point, B-24
  - electronic configuration, B-1
  - gravimetric factors, logs of, B-178

- Vaporization, latent heat of, definition, F-114
- Vapors
  - air pollutants, human exposure to, D-123
  - definition, F-130
  - inflammability of, in air, D-122
- Variables, separation of, method of solution, A-120
- Vector calculus, see Calculus, vector
- Vectors, composition of, equation, F-131
- Vedernikov number, definition, F-340
- Vegetables, approximate pH value of, D-149
- Velocity
  - acoustic, F-91
  - definition, F-131
  - dimensionless groups, F-346
  - efflux of a liquid, equations, F-131
  - equation, F-131
  - escape, F-105
  - escape, for planets, their satellites and some asteroids, F-180
  - escape, for planets, their satellites and some asteroids compared to Earth's, F-185
  - escape, mean, for planets and the Moon, F-187
  - escape, solar, for planets and the Moon, F-187
  - group, definition, F-131
  - light, in meters per second, F-192
  - orbital, for planets, their satellites and some asteroids, F-180
  - orbital, for planets, their satellites and some asteroids compared to Earth's, F-185
  - orbital, mean, for planets and the Moon, F-187

  particle definition, F-131
  phase, definition, F-131
  relative to Earth's planets and their satellites, F-185
  rotational, mean, for planets and the Moon, F-187
  volume, F-131
  waves
    compressional, equations, F-131
    equation, F-131
    longitudinal, equations, F-131
    seismic, F-204
    transverse, equation, F-131
    water, equation, F-131
Velocity, sound, see Sound, velocity
Velocity Heads, number, definition, F-338
Velocity number, definition, F-340
Venus, physical data for, F-176—187
Verdet constant for magnetic rotary power of organic compounds, E-413—415
Vibrating strings, frequency of, equations, F-108
Virtual gravity, definition, F-131
Virtual height, definition, F-131
Virtual image, definition, F-131
Virtual mass, definition, F-131
Viscosity
  air, 300°K to 2800°K at 20, 30 and 40 Atm., F-13—15
  conversion centistokes to Saybolt and Redwood seconds, F-49
  conversion factors from cgs units to SI and English units, F-12
  conversion table, units of absolute and kinematic, F-49—50
  definition, F-131
  definition and formula, F-49
  dimensionless groups, F-345
  dynamic, F-102
  eddy, F-102
  fluorocarbon refrigerants, E-34—35
  gases, table, F-58—61
  kinematic, F-114
  liquids, table, F-52—57
  oxygen as a function of temperature, F 74—76
  oxygen at saturation, F-79
  ozone and oxygen, F-80—81
  potassium, liquid state and liquid sodium, F-84
  Redwood seconds from centistokes, table, F-49
  Saybolt seconds from centistokes, table, F-49
  sodium, liquid state and liquid potassium, F-84
  sodium and Na-K alloys, F-83
  Stoke's law, F-127—128
  water, 0°C to 100°C, table, F-51
  water, absolute viscosity at 20°C, F-49
  water below 0°C, F-49
Viscosity, absolute, conversion to, D-227
Viscosity effect, definition, F-131
Viscosity, kinematic
  inorganic substances, selected, varying concentration in aqueous solution, table, D-229—276
  organic substances, selected, varying concentration in aqueous solution, table, D-229—276
Viscosity, relative
  inorganic substances, selected, varying concentration in aqueous solution, table, D-229—276
  organic substances, selected, varying concentration in aqueous solution, table, D-229—276
Viscosity, specific, conversion to, D-227
Viscosity effect, definition, F-131
Viscosity number, surface, definition, F-339
Visibility, definition, F-131
Visibility, relative (standard observer), E-258
Volt
  definition, F-104, 131
  international, definition, F-104
Voltages, calibration of spark-gap for, E-55
Volume
  conversion factors, F-307—329
  Earth, F-194
  mercury, −10°C to 360°C, F-7
  planets and their satellites compared to Earth's, F-185
  unit of, F-131
Volume, specific, see Specific volume
Volume conductivity, definition, F-98
Volume expansion, equation, F-129
Volume velocity, definition, F-131
Volumetric glassware, calibration, D-144
Volumeric apparatus, glass, temperature correction, F-3
Volumeric solutions, temperature correction for, F-2
von Baeyer notation for bridged hydrocarbons, C-18
Von Ettinghausen's effect, F-105

W

Wagner's reagent, preparation of, D-137
Wagner's solution, preparation of, D-137
Walden's rule, F-131
Washburn and Moen wire gauge, F-162
Water
  absolute index (refraction) of pure, 15°C — 100°C, E-386
  azeotropes, table, D-1—44
  boiling point, hydrogen scale, 700—800 mm pressure, D-186
  boiling point correction to standard pressure, D-193
  compressibility, isothermal, of liquid, F-20
  correction, temperature for volumetric solutions, F-2
  density of pure, air-free 0°C to 100°C, F-11
  dielectric constant 0°C to 100°C, E-61
  enthalpy
    air-free 0°C—100°C at 1 atm, D-174
    air saturated 0°—100°C at 1 atm., table, D-211
  heat capacity, air-free 0°—100°C at 1 atm., table., D-174
  heavy, dielectric constant of, E-61
  heavy, ionization constants, D-168
  index of refraction of pure, 14°C-100°C, E-386
  ionization constant 0°C to 60°C, D-168
  ordinary, specific volume, density, compressibility, thermal expansivity −20°C to 150°C, F-5—6
  reserve, total, in Earth's mantle, F-197
  saturated, and saturated steam, properties (steam tables), E-18—23
  sea, concentrative properties of, in varying concentration, D-258
  sea, density of, F-3
  sea, elements present in solution, F-214
  specific heat, D-174—175
  specific heat at constant pressure of saturated steam and saturated water (steam tables), E-24—25

  surface tension against air, F-45
  thermal conductivity, E-11
  thermal conductivity of gaseous, E-3
  vapor pressure above 100°C, D-197
  vapor pressure below 100°C, D-196
  velocity of sound, temperature above 212°F, E-47—48
  viscosity
    absolute at 20°C, F-49
    below 0°C, table, F-49
  table of values 0°C to 100°C, F-51
  volume properties at 1 atm., F-5—6
  weight of 1 U.S. gallon, 0°C to 100°C, table, F-2
Water (aqueous), vapor pressure
  over ice, −98° to 0°C, D-195
  over water, above 100°C, D-197
  over water, below 100°C, D-196
Water equivalent, definition, F-129
Water vapor, saturated, weight in grams of cubic meter, E-41
Watt, definition, F-132
Wave, definition, F-132
Wave energy, longitudal, definition, F-115
Wavefront, definition, F-132
Wavelength, definition, F-132
Wave length (Spectra)
  copper, vacuum UV, table, E-212
Wave lengths
  Fraunhofer lines, E-214
  light sources for spectroscope calibration, E-214
  radiations, various, E-214
Wavelength to energy conversion (X-ray), E-140
Wave motion, definition, F-132
Wave number, definition, F-132, 343
Waxes
  acid value, C-769
  density, of some, F-1
  dielectric constants, E-60
  friction, coefficient of
    kinetic, for waxed hickory on snow, F-23
    static, for paraffin, ski, and swiss, on snow, F-23
  index of refraction, C-769
  iodine value, C-769
  melting point, table, C-769
  saponification value, C-769
  specific gravity or density, C-769
Weather, fair, atmosphere, electrical parameters of, F-212—213
Weather, thunderstorm electricity in, F-213
Weber, definition, F-132
Weber number, definition, F-340, 343
Webers, conversion factors for, F-328
Weighings in air to vacuo, correction factors, D-146
Weight, definition, F-132
Weight and mass, definition, F-117
Weight and measure
  conversion factors used in, table, F-307—329
  units
    abbreviations of commonly used, F-306
    spelling and symbols, F-285
Weight, pound, definition, F-121
Weiss, modification to Curie law, F-99
Weissenberg number, definition, F-340
Weissenberg number, generalized, definition, F-343
Welsbach mantle, luminance of, E-213
Wet and dry bulb thermometer
  relative humidity from, table, E-45
  reduction of psychrometric observation, E-45
Weys, conversion factors for, F-329
Wheatstone's bridge, equation, F-132
Whiskers, mechanical and physical properties of, F-84
Wien effect, F-132
Wien's displacement constant, definition, F-132
Wien's displacement law, definition, F-132
Wij's iodine monochloride solution, preparation of, D-137
Wij's special solution, preparation of, D-137
Wire, allowable carrying capacities of conductors, F-164
Wire, platinum, mass in grams per foot, F-164
Wire dimensions, Stubs and British standard gauge, F-163
Wire gauge, steel and twist drill, table, F-163
Wire gauges, comparison of, F-162
Wire materials, lead, physical properties, F-160—161
Wire table, aluminum, F-166
Wire table, standard annealed copper, tables, F-164—166
Wire tables, comparison of wire gauges, diameter of commercial, F-162
Wires, cross-section and mass, F-167—168
Wires, resistance of, tables for several metals, F-168—170
Wolfram, see Tungsten
Wood
  densities of various, tables, F-1
  friction, coefficient of kinetic
    hickory, waxed and unwaxed on snow, ice, F-23
  friction, coefficient of static, F-21
  thermal conductivity, for various, E-5
  velocity of sound in various, E-47
Work, definition, F-132
Work, electrical, equation, F-121
Work, maximum, Berthelot principle, F-94
Work function, definition, F-132
Work functions of the elements, E-82—83
Wratten filters
  identifying number, color, use, stability, E-402—403
  transmittance percent, tables, E-403—409

MELTING AND BOILING POINTS, AND ATOMIC WEIGHTS OF THE ELEMENTS

Based on the Assigned Relative Atomic Mass of ^{12}C = 12

The following values apply to elements as they exist in materials of terrestrial origin and to certain artificial elements. When used with the footnotes, they are reliable to ±1 in the last digit, or ±3 if that digit is in small type.

Name	Symbol	Atomic number	Atomic weight	Melting point, °C	Boiling point, °C
Actinium[k]	Ac	89	227.028	1,050	3,200 ± 300
Aluminum	Al	13	26.98154[b]	660.37	2,467
Americium	Am	95	(243)	994 ± 4	2,607
Antimony	Sb	51	121.75*	630.74	1,750
Argon[h,i]	Ar	18	39.948*[b,c,d,g]	-189.2	-185.7
Arsenic (gray)	As	33	74.9216[a]	817(28 atm)	613(sub.)
Astatine	At	85	(210)	302	337
Barium[i]	Ba	56	137.33	725	1,640
Berkelium	Bk	97	(247)	–	–
Beryllium	Be	4	9.01218[a]	1,278 ± 5	2,970(5 mm)
Bismuth	Bi	83	208.9804[a]	271.3	1,560 ± 5
Boron[h,j]	B	5	10.81[c,d,e]	2,300	2,550(sub.)

[a] Mononuclidic element.

[b] Element with one predominant isotope (about 99 to 100% abundance).

[c] Element for which the atomic weight is based on calibrated measurements.

[d] Element for which variation in isotropic abundance in terrestrial samples limits the precision of the atomic weight given.

[e] Element for which users are cautioned against the possibility of large variations in atomic weight due to inadvertent or undisclosed artificial isotropic separation in commercially available materials.

[f] Most commonly available long-lived isotope.

[g] In some geological specimens this element has a highly anomalous isotopic composition, corresponding to an atomic weight significantly different from that given.

[h] Element for which known variations in isotopic composition in normal terrestrial material prevent a more precise atomic weight given; A_r (E) values should be applicable to any "normal" material.

[i] Element for which geological specimens are known in which the element has an anomalous isotopic composition, such that the difference in atomic weight of the element in such specimens from that given in the Table may exceed considerably the implied uncertainty.

[j] Element for which substantial variations in A_r from the value given can occur in commercially available material because of inadvertent or undisclosed change of isotopic composition.

[k] Element for which the value A_r is that of the radioisotope of longest half-life.
